TERMS OF USE AND DISCLAIMER

The Global Competitiveness Report 2016–2017 (herein: "Report") presents information and data that were compiled and/or collected by the World Economic Forum (all information and data referred herein as "Data"). Data in this Report is subject to change without notice

The terms country and nation as used in this Report do not in all cases refer to a territorial entity that is a state as understood by international law and practice. The terms cover well-defined, geographically self-contained economic areas that may not be states but for which statistical data are maintained on a separate and independent basis.

Although the World Economic Forum takes every reasonable step to ensure that the Data thus compiled and/or collected is accurately reflected in this Report, the World Economic Forum, its agents, officers, and employees: (i) provide the Data "as is, as available" and without warranty of any kind, either express or implied, including, without limitation, warranties of merchantability, fitness for a particular purpose and non-infringement; (ii) make no representations, express or implied, as to the accuracy of the Data contained in this Report or its suitability for any particular purpose; (iii) accept no liability for any use of the said Data or reliance placed on it, in particular, for any interpretation, decisions, or actions based on the Data in this Report.

Other parties may have ownership interests in some of the Data contained in this Report. The World Economic Forum in no way represents or warrants that it owns or controls all rights in all Data, and the World Economic Forum will not be liable to users for any claims brought against users by third parties in connection with their use of any Data.

The World Economic Forum, its agents, officers, and employees do not endorse or in any respect warrant any third-party products or services by virtue of any Data, material, or content referred to or included in this Report.

Users shall not infringe upon the integrity of the Data and in particular shall refrain from any act of alteration of the Data that intentionally affects its nature or accuracy. If the Data is materially transformed by the user, this must be stated explicitly along with the required source citation.

For Data compiled by parties other than the World Economic Forum, as specified in the "Technical Notes and Sources" section of this Report, users must refer to these parties' terms of use, in particular concerning the attribution, distribution, and reproduction of the Data.

When Data for which the World Economic Forum is the source (herein "World Economic Forum"), as specified in the "Technical Notes and Sources" section of this Report, is distributed or reproduced, it must appear accurately and be attributed to the World Economic Forum. This source attribution requirement is attached to any use of Data, whether obtained directly from the World Economic Forum or from a user.

Users who make World Economic Forum Data available to other users through any type of distribution or download environment agree to make reasonable efforts to communicate and promote compliance by their end users with these terms.

Users who intend to sell World Economic Forum Data as part of a database or as a standalone product must first obtain the permission from the World Economic Forum (gcp@weforum.org).

Partner Institutes

The World Economic Forum's Global Competitiveness and Risks Team is pleased to acknowledge and thank the following organizations as its valued Partner Institutes, without which the realization of The Global Competitiveness Report 2016-2017 would not have been feasible:

Albania

Institute for Contemporary Studies (ISB) Artan Hoxha, President Elira Jorgoni, Senior Expert Endrit Kapaj, Expert

Algeria

Centre de Recherche en Economie Appliquée pour le Développement (CREAD) Mohamed Yassine Ferfera, Director Khaled Menna, Research Fellow

Argentina

IAE-Universidad Austral Carlos Marcelo Belloni, Research Analyst Eduardo Fracchia, Director of Academic Department of **Economics**

Armenia

Economy and Values Research Center Manuk Hergnyan, Chairman Sevak Hovhannisyan, Board Member and Senior Associate

Australia

Australian Industry Group Colleen Dowling, Economics Research Coordinator Julie Toth, Chief Economist Innes Willox, Chief Executive

Austria

Austrian Institute of Economic Research (WIFO) Christoph Badelt, Director Gerhard Schwarz, Coordinator, Survey Department

Azerbaijan Marketing Society Fuad Aliyev, Deputy Chairman Ashraf Hajiyev, Consultant

Bahrain

Bahrain Economic Development Board Khalid Al Rumaihi, Chief Executive Nada Azmi, Manager, Competitiveness Observatory Fatema Al Atbi, Junior Officer, Competitiveness Observatory

Bangladesh

Centre for Policy Dialogue (CPD) Khondaker Golam Moazzem, Additional Research Director Meherun Nesa, Research Associate Mustafizur Rahman, Executive Director

Barbados

The Sir Arthur Lewis Institute of Social and Economic Studies Don. D. Marshall, Director

Belgium

Vlerick Business School Wim Moesen, Professor Carine Peeters, Professor Leo Sleuwaegen, Professor, Competence Centre Entrepreneurship, Governance and Strategy

Benin

Institut de Recherche Empirique en Economie Politique (IREEP) Richard Houessou, Research Associate Romaric Samson, Research Assistant

Léonard Wantchekon, Director

Bhutan Chamber of Commerce & Industry (BCCI) Tshering Lhaden, NTM Desk Officer Phub Tshering, Secretary General Kesang Wangdi, Deputy Secretary General

Bosnia and Herzegovina

MIT Center, School of Economics and Business in Sarajevo, University of Sarajevo Zlatko Lagumdzija, Professor Zeliko Sain, Executive Director Jasmina Selimovic, Assistant Director

Botswana

Botswana National Productivity Centre Letsogile Batsetswe, Research Consultant and Statistician Baeti Molake. Executive Director Phumzile Thobokwe, Manager, Information and Research Services Department

Brazil

Fundação Dom Cabral, Innovation Center Carlos Arruda, Professor and Director FDC Innovation and Entrepreneurship Center Ana Burcharth, Associate Professor Fernanda Bedê, Research Assistant

Brunei Darussalam

Energy and Industry Department at the Prime Minister's Office Awang Adi Shamsul bin Haji Sabli, Permanent Secretary of

University of Brunei Darussalam (UBD) Datin Dayang Hajah Anita Binurul Zahrina binti Pehin Orang Kaya Laila Wijaya Dato Seri Setia Haji Awang Abdul Aziz, Vice-Chancelllor

Bulgaria

Center for Economic Development Adriana Daganova, Expert, International Programmes and Anelia Damianova, Senior Expert

Burundi

Faculty of Economics and Management, Research Centre for Economic and Social Development (CURDES), National University of Burundi

Ferdinand Bararuzunza, Director of the Centre Gilbert Niyongabo, Head of Department Léonidas Ndayizeye, Dean of the Faculty

Cambodia

Nuppun Institute for Economic Research (NUPPUN) Chakriya Heng, Administrative Assistant Pisey Khin, Director Chanthan Tha, Senior Research Assistant

Cameroon

Comité de Compétitivité (SELPI) Lucien Sanzouango, Permanent Secretary Guy Yakana, Expert Junior Samuel Znoumsi, Expert Senior

Canada

The Conference Board of Canada Michael R. Bloom, Vice President Jessica Edge, Senior Research Associate Natalie Verania, Marketing and Administrative Assistant

Cape Verde

Center for Applied Statistics and Econometrics Research -Júlio Delgado, Director

Jerónimo Freire, Project Manager José Mendes, Chief Executive Officer

Groupe de Recherches Alternatives et de Monitoring du Projet Pétrole-Tchad-Cameroun (GRAMP-TC) Antoine Doudjidingao, Researcher Gilbert Maoundonodji, Director Celine Nénodji Mbaipeur, Programme Officer

Chile

School of Government, Universidad Adolfo Ibáñez Ignacio Briones, Dean Julio Guzman, Assistant Professor Pamela Saavedra, Assistant

China

Institute of Economic System and Management Chen Wei, Division Director and Professor Li Xiaolin, Research Fellow Li Zhenjing, Deputy Director and Professor

The China Center for Economic Statistics Research, Tianjin University of Finance and Economics

Bojuan Zhao, Professor Lu Dong, Professor Jian Wang, Associate Professor Hongye Xiao, Professor Huazhang Zheng, Associate Professor

Chinese Taipei

National Development Council Shien-Quey Kao, Deputy Minister Chung-Chung Shieh, Researcher, Economic Research Department

Minghuei Wu, Director, Economic Research Department

Colombia

National Planning Department Simon Gaviria, Director National Planning Department Adriana Quiñones, Project Manager Andres Felipe Trejos, Director of Enterprise Development

Colombian Private Council on Competitiveness Rosario Córdoba, President Rafael Puyana, Vice President

Congo, Republic Democratic of

Congo-Invest Consulting (CIC) Teza Bila, Managing Director Alphonse Mande, Project Coordinator Daddy Nsiku, Project Coordinator

Côte d'Ivoire

Chamber of Commerce and Industry of Côte d'Ivoire Marie-Gabrielle Boka Varlet, General Manager Anzoumane Diabakate, Head of Communication Jean-Rock Kouadio-Kirine, Head of Territories and sustainable development

Croatia

National Competitiveness Council Jadranka Gable, Advisor Kresimir Jurlin, Research Fellow

Cyprus

European University of Cyprus Research Center Bambos Papageorgiou, Head of Socioeconomic & Academic Research

Bank of Cyprus Public Company Ltd Maria Georgiadou, Consultant for Innovation & Entrepreneurship Charis Pouangare, Director of Corporate Banking and SME

Preface

RICHARD SAMANS

Head of the Centre for the Global Agenda and Member of the Managing Board, World Economic Forum

The Global Competitiveness Report 2016-2017 is being launched at a time of rising income inequality, mounting social and political tensions, and a general feeling of uncertainty about the future. Growth remains persistently low: commodity prices have fallen, as has trade; external imbalances are increasing; and government finances are stressed. However, it also comes during one of the most prosperous and peaceful times in recorded history, with less disease, poverty, and violent conflict than ever before. Against this backdrop of seeming contradictions, the Fourth Industrial Revolution brings both unprecedented opportunity and an accelerated speed of change.

Creating the conditions necessary to reignite growth could not be more urgent. The Report this year is the latest edition of the Forum's longstanding cross-country benchmarking analysis of the factors and institutions that determine long-term growth and prosperity. Incentivizing innovation is especially important for finding new growth engines, but laying the foundations for long-term, sustainable growth requires working on all factors and institutions identified in the Global Competitiveness Index. Leveraging the opportunities of the Fourth Industrial Revolution will require not only businesses willing and able to innovate, but also sound institutions, both public and private; basic infrastructure, health, and education; macroeconomic stability; and well-functioning labor, financial, and human capital markets.

Although there is broad consensus on the importance of the factors currently measured in the Index, we are undertaking a review process that seeks to understand the impact of the Fourth Industrial Revolution on measures of productivity and the drivers of growth. In the second chapter of this Report, we present our thinking regarding the potential future structure of the Index, building on consultations with experts on each pillar under the thought leadership of our main academic advisor, Professor Xavier Sala-i-Martín. It explores new ways of assessing innovation, human capital, and competitiveness at different stages of development, as well as our latest thinking on how our benchmarking tools can be used for policy prioritization.

We face a large challenge—how to build a more prosperous and inclusive world for all. As a flagship effort of the Forum's System Initiative on Economic Growth and Social Inclusion, The Global Competitiveness Report serves as a tool for public-private collaboration on long-term competitiveness agendas contributing to this objective.

As well as the thought leadership of Professor Sala-i-Martín, The Global Competitiveness Report 2016-2017 has benefited from the dedication and collaboration of 160 Partner Institutes worldwide. We would like to convey our appreciation to all the business executives who respond to our Executive Opinion Survey, one of the unique components of the Index. Appreciation also goes to Professor Klaus Schwab, Executive Chairman, who developed the original concept back in 1979; Jennifer Blanke, Chief Economist; Margareta Drzeniek Hanouz, Head of Global Competitiveness and Risks; and team members Silja Baller, Attilio Di Battista, Ciara Browne, Roberto Crotti, Caroline Galvan, Thierry Geiger, Daniel Gómez Gaviria, Gaëlle Marti, and Stéphanie Verin.

The Global Competitiveness Report 2016-2017 comes out in the context of persistent slow growth and a nearterm outlook that is fraught with renewed uncertainty fueled by continued geopolitical turmoil, financial market fragility, and sustained high debt levels in emerging markets. Despite unorthodox monetary policy, global GDP growth has fallen from levels of 4.4 percent in 2010 to 2.5 percent in 2015. This fall in growth reflects not only the productivity slowdown documented in last year's Report, which has continued during 2016, but also what now seems like a long-term downward trend in investment rates.1

Future growth prospects are constrained by longerterm trends. Many economies around the world struggle with the double challenges of slowing productivity growth and rising income inequality, often exacerbated by rapidly aging societies. Stagnating and unequally distributed income growth in turn has opened the door to more inward-looking policies, mounting protectionist pressures, and a general questioning of the premises underlying globalization in many economies—most visibly embodied in the recent Brexit vote. At the same time, in emerging markets, the end of the commodity supercycle has led to an abrupt economic slowdown that has exposed the slow pace or lack of competitivenessenhancing reforms in recent years, which could increase polarization and threaten social cohesion.

On the bright side, tremendous promise for higher economic growth and societal progress dawns with the Fourth Industrial Revolution.² Based on digital platforms, the Fourth Industrial Revolution is characterized by a convergence of technologies that is blurring the lines between the physical, digital, and biological spheres (Box 1). Breakthroughs in technologies such as artificial intelligence, biotechnology, robotics, the Internet of Things, and 3D printing, to name a few, will provide new avenues for growth and development in the future but could also give rise to significant social challenges.

The political and ideological constraints placed on fiscal policy in the wake of the financial crisis left monetary policy as the only option for governments in advanced economies to try to avert secular stagnation.3 Although this may have been successful in stabilizing growth in the short term, ensuring a higher future growth path will necessitate continued competitivenessenhancing supply-side reforms and investment to strengthen productive sectors. And as the Fourth Industrial Revolution is gathering speed, it will be increasingly important to support the emergence of new sectors of economic activity through competitiveness reforms that foster innovation. Yet, as the Global

The authors would like to thank Miso Lee for research support for this Report.

Box 1: The Fourth Industrial Revolution

We are at the beginning of a global transformation that is characterized by the convergence of digital, physical, and biological technologies in ways that are changing both the world around us and our very idea of what it means to be human. The changes are historic in terms of their size, speed, and scope.

This transformation—the Fourth Industrial Revolution-is not defined by any particular set of emerging technologies themselves, but rather by the transition to new systems that are being built on the infrastructure of the digital revolution. As these individual technologies become ubiquitous, they will fundamentally alter the way we produce, consume, communicate, move, generate energy, and interact with one another.

And given the new powers in genetic engineering and neurotechnologies, they may directly impact who we are and how we think and behave. The fundamental and global nature of this revolution also poses new threats related to the disruptions it may cause—affecting labor markets and the future of work, income inequality, and geopolitical security as well as social value systems and ethical frameworks.

Adapted from Klaus Schwab, The Fourth Industrial Revolution, 2016.

Competitiveness Index (GCI) shows, to date, progress in building an enabling environment for innovation remains the advantage of only a few economies. Last but not least, future growth will also depend on the ability of economies to safeguard the benefits of openness to trade and investment that has led to record reductions in poverty rates in recent decades.4

Against this background, this Report serves as a critical reminder of the importance of competitiveness in solving both our international macroeconomic challenges and laying the ground for future prosperity.

Recovering growth in the context of the Fourth Industrial Revolution will require the recognition that policymakers need a shared assessment and understanding of the future sources of competitiveness. By reducing complexity and providing a tool to identify strengths and weaknesses and track progress, the Report serves as a means to inform this conversation and to support policymakers, businesses, and civil society in their development of a shared long-term vision (see Box 2 for two examples of how the Report is being used).

In the next section of this chapter we present the methodology and framework underpinning the GCI. It is followed by an overview of the results, where we develop the key findings. The chapter continues by exploring regional highlights, showing great differences within regions and their main competitiveness gaps, trends, and challenges. Highlights for selected economies in the top 10 of the rankings, G20 economies, and countries

selected for World Economic Regional Summits in 2017 follow.

The second chapter presents the framework of the modernized Global Competitiveness Index and some preliminary results, building on work presented in The Global Competitiveness Report 2015-2016. It highlights new indicators, new concepts of innovation, new approaches to measuring human capital, and a new approach to policy prioritization. The third chapter describes the Executive Opinion Survey, an invaluable and unique source of current data from which we derive a large number of indicators used in the GCI. The Country/Economy Profiles section at the end of the Report presents the detailed GCI results by economy and is a useful complement to the present chapter.5

METHODOLOGY

We define competitiveness as the set of institutions. policies, and factors that determine the level of productivity of an economy, which in turn sets the level of prosperity that the country can achieve.

Since 2005, building on Klaus Schwab's original idea of 1979, the World Economic Forum has published the Global Competitiveness Index (GCI) developed by Xavier Sala-i-Martín in collaboration with the Forum. The GCI combines 114 indicators that capture concepts that matter for productivity and long-term prosperity (described in greater detail in Appendix A).

These indicators are grouped into 12 pillars (Figure 1): institutions, infrastructure, macroeconomic environment, health and primary education, higher education and training, goods market efficiency, labor market efficiency, financial market development, technological readiness, market size, business sophistication, and innovation. These pillars are in turn organized into three subindexes: basic requirements, efficiency enhancers, and innovation and sophistication factors. The three subindexes are given different weights in the calculation of the overall Index, depending on each economy's stage of development, as proxied by its GDP per capita and the share of exports represented by raw materials. Appendix A presents a description of each pillar, a classification of economies by stage of development, the detailed structure of the GCI, and a description of the various steps of its computation, including normalization and aggregation.6

The GCI includes statistical data from internationally recognized organizations, notably the International Monetary Fund (IMF); the World Bank; and various United Nations' specialized agencies, including the International Telecommunication Union, UNESCO, and the World Health Organization. The Index also includes indicators derived from the World Economic Forum's Executive Opinion Survey that reflect qualitative aspects of competitiveness, or for which comprehensive and

Figure 1: The Global Competitiveness Index framework

See Appendix A for the detailed structure of the GCI.

comparable statistical data are not available for a sufficiently large number of economies (see Chapter 1.3).

The Report this year covers 138 economies included based on data availability. Some have been reinstated in the 2016 edition of the Survey after one or more years of exclusion. These are Barbados and Yemen (last included in 2014) and Brunei Darussalam (last included in 2013). For the first time ever, the Survey was administered in the Democratic Republic of Congo. However, it was not completed to minimum requirements in Guinea, Guyana, Haiti, Myanmar, Seychelles, and Swaziland. For this reason, these economies are not included in this year's edition of the Report. Altogether, the combined output of the economies covered in the GCI accounts for 98 percent of world GDP.7

RESULTS OVERVIEW AND MAIN FINDINGS

Table 1 presents the rankings of the GCI 2016–2017 and Appendix B reports the rankings by pillar and subindex. Many of the competitiveness challenges we see today stem from the aftermath of the financial crisis. Today, productivity and growth are not picking up in advanced economies, and the consequences of low and even negative productivity growth in many emerging economies are now evident. The great recession led many advanced economies to implement very loose monetary policy, which in turn fueled a global commodities boom (Box 3) that masked many of the competitiveness challenges of commodity-exporting emerging markets. Vulnerability to commodity price fluctuations in emerging economies and the promises of the Fourth Industrial Revolution underscore the importance of innovation as a source of competitiveness and economic diversification to reignite growth.

Against this background, it is clear that (1) monetary stimulus is not enough to reignite growth if economies are not competitive, (2) an increasingly important element of competitiveness is creating an enabling environment for innovation, and (3) innovation in turn goes hand in hand with openness and economic integration.

Monetary policy is not enough: Insufficient competitiveness is a constraint for reigniting growth worldwide

In the aftermath of the 2007-2009 financial crisis, many central banks and governments have resorted to monetary policy to try to jumpstart growth. However, near-zero or negative real interest rates have left little further scope for traditional monetary policy, and quantitative easing—the process of buying assets and increasing the size of central bank balance sheets—has delivered mixed results in spurring growth.

Box 2: The Global Competitiveness Index as a public policy tool

The Global Competitiveness Report, published since 1979, aims to serve as a neutral and objective tool for governments, the private sector, and civil society to work together on effective public-private collaboration to boost future prosperity. By benchmarking each year's progress on different factors and institutions that matter for future growth, the Report keeps competitiveness on the public agenda, provides a focal point for the discussion of long-term competitiveness policies, and helps to keep stakeholders accountable

The ability to compare 138 economies on a variety of indicators helps them to assess gaps and priority areas and to construct joint, public-private agendas to address them. The annual updating of the Index allows countries to track their progress and reassess their agendas, adjusting them if necessary. Some countries have used the Index to build entire competitiveness systems and formally organize their institutions for competitiveness, as illustrated by two examples from Latin America and the Caribbean: the Dominican Republic and Colombia.

The Dominican Republic

In 2014, a group of leading Dominican business leaders began discussions about increasing the country's competitiveness levels, and mitigating the risks it faces, through a public-private partnership. In August 2015, the Initiative for National Productivity and Competitiveness (IPCN in Spanish) was created by presidential decree and tasked with identifying and promoting actions and reforms that would strengthen productivity and competitiveness.1

The IPCN comprises 35 business leaders and five government ministers: the Minister of the Presidency; the Minister of Industry and Commerce; the Minister of Economics, Planning and Development; the Minister of Finance; and the Administrative Minister of the Presidency. Members of the IPCN agreed to use globally recognized indicators, particularly the Global Competitiveness Index (GCI), to set common goals and coordinate actions between the public and private sectors through three mechanisms:

- Nine working groups, organized around the GCI's 12 pillars of competitiveness, are responsible for formulating action plans and proposals—with priority given to the groups working on pillars on which the Dominican Republic is underperforming. After the first working period, 15 projects were selected, including legal reforms to facilitate creating businesses, a digital platform for import and export procedures, structural changes to improve the transportation system, adjustments to quality control processes, and amendments to taxation legislation.
- The Ventanilla de Consultas is an online platform that serves as a communication channel between the public and the IPCN-any citizen may propose actions to improve national or regional competitiveness and productivity. So far this has led to the creation of a commission to aid the private sector in its preparations for an evaluation by the Financial Action Task Force, and to a presidential decree protecting low-income homeowners from new tax legislation.

· The Public-Private Partnerships Promotion Unit identifies and evaluates public-private investment projects that could have a large impact on national development, benchmarking them against international PPP best practices. A new PPP law is being written by a team of experts, including the IPCN's technical support committee and other members of the public and private sectors.

Colombia

The National System of Competitiveness (SNC) was established in 2006 to coordinate the activities of Colombia's national government with the private sector, academia, and civil society on issues related to productivity and economic development. Regional Commissions for Competitiveness (RCCs) were also created, to coordinate policy implementation. Within this system, the Private Competitiveness Council was launched by a group of large Colombian firms and universities to be the voice of the private sector. The Council now constitutes the system's think tank, and uses tools such as The Global Competitiveness Report.2

The system is coordinated by a Presidential Adviser for Competitiveness and Innovation and led by an Executive Committee composed of three government officials (the Minister of Trade and Industry, the Director of National Planning, and the Director of Colciencias [the National Administrative Department for Science, Technology and Innovation]) and two representatives from the private sector (President of the Private Competitiveness Council and President of Confecamaras [the Business Association of Chambers of Commerce]). The Executive Committee also coordinates work with the RCCs and presents annual reports to the National Competitiveness Assembly.

In an ongoing effort to improve capacity to make progress on the competitiveness agenda, the system was recently merged with the Science, Technology and Innovation System; a project management model was implemented; and governance was revamped to better coordinate with the regions and improve empowerment and accountability by introducing a requirement for the Executive Committee to report to the full Council of Ministers.

The system has successfully improved coordination among government agencies, producing a policy document on productive development and implementing an 11-point competitiveness agenda with concrete projects and accountability.

Note: The Global Competitiveness Index captures the determinants of long-term growth. Recent developments (for example, Brexit, commodity price changes, and market volatility) are reflected only in so far as they have an impact on the data measuring these determinants. The Index should be interpreted in this context. See "Economy highlights" on pages 25–31 for a brief analysis of the performance of selected economies and the "Country/Economy Profiles" for detailed results for all economies. "n/a" = not available (the economy was not covered in that edition of the

Box 3: Competitiveness at the end of the commodity boom

Today's competitiveness landscape is the outcome of developments stemming from the global financial crisis which spread negative wealth shocks and contractionary effects from the United States to Europe and beyond.¹ After reducing interest rates toward zero and all but exhausting the possibilities of conventional monetary policy to spur recovery, policymakers resorted to more unorthodox solutions. Central banks' strategy of quantitative easing continues today, as they inflate their balance sheets and keep interest rates at record lows. This box explores the link between these well-known macro policies and diversification and competitiveness.

The end of the commodity super-cycle and the sharp drop in prices, mainly of oil and minerals but also of food and agricultural products, reveals a close relationship between commodity dependence and competitiveness and provides lessons going forward. As prices of commodities soared following the global financial crisis, reinforced by strong demand from a few large emerging markets known as the BRICs (Brazil, Russia, India, and China), the weight of commodities in the export baskets of commodity-rich economies increased. The continued strong growth of the BRIC economies, particularly China, reinforced the commodity super-cycle that had begun in 2000 after the long slump of the 1980s and 1990s.² Close-to-zero interest rates in advanced economies induced large capital flows into emerging markets that went to these profitable commodity sectors. The dollar depreciation super-cycle was matched by currency appreciations that some claim produced Dutch disease phenomena in emerging markets. Commodity sectors attracted resources and manufacturing sectors found it harder to export and harder to attract investment.

The end of the commodity super-cycle, and in particular the pronounced fall in oil prices in response to increased supply of unconventional oil sources, especially in the United States, produced a large drop in the value of exports, current account deficits, government budget deficits, and large currency depreciations. As the US economy slowly recovered and monetary policy was expected to normalize, capital flows toward emerging markets fell. Many policymakers and analysts hoped that exchange rate depreciations would lead to increased exports of manufacturing goods. They soon realized that, for a variety of reasons—including depressed global trade in general, smaller real versus nominal depreciations, and the changing structure of global value chains and international trade-export elasticities had

become smaller than they used to be (exports became less responsive to changes in the exchange rate).3

The key lesson learned, however, is that the process of starting to produce new goods in new sectors and managing to export them is hard. It requires having productivity levels beyond those achieved by commodity-exporting economies. Indeed, using the IMF Diversification Index, we find that more competitive economies also have more diversified export baskets, and more diversified economies are more competitive. The link between productivity and exports is well understood in the firm-level trade literature.4 and the relationship between diversification and productivity has been explored in Hausmann and Klinger (2006) and Juvenal and Santos Monteiro (2013), among others. Figure 1 shows the relationship between competitiveness and diversification.

The mechanism linking diversification and competitiveness comes via the effect of the fall in mineral and oil prices on the value of exports and on government deficits

Figure 1: Correlation between GCI score and diversification

Source: Authors' calculations based on IMF Diversification Index. Note: Higher diversification scores indicate more concentrated (less diversified) export baskets based on a sample of 117 economies

(Cont'd.)

Figure 2 shows how economies that perform poorly in the GCI have seen their central banks boost their balance sheets more than better-performing economies, and yet those with higher competitiveness have recovered faster from the financial crisis and ensuing recession, achieving faster growth rates. The fact that monetary stimulus has been more effective and growth has been higher in more competitive economies, regardless of fiscal policies followed, suggests that the constraints may be on the supply side. Improving the

conditions for businesses to flourish and increase their productivity is therefore the main policy challenge for advanced and emerging economies alike.

At the dawn of the Fourth Industrial Revolution era, technology and innovation are increasingly driving development

As a new wave of technological convergence and digitalization materializes in the Fourth Industrial Revolution, innovation and business sophistication,

Box 3: Competitiveness at the end of the commodity boom (cont'd.)

and inflation, which increases as a result of depreciation passthrough. In turn, as falling exports affect competitiveness through the deterioration of the macroeconomic environment, it is harder for new firms and new sectors to flourish. Additional mechanisms involve the incentives of cash-rich commodity exporters to make the investments and take the policy actions that would lead to increased competitiveness of alternative sectors.

These incentive effects are reflected in the composition of changes in the Index for net commodity exporters. Figure 2 shows the decomposition of changes in the GCI between 2008 and 2016. In particular, the business sophistication and innovation pillars fall for net exporters of commodities following the negative terms-of-trade shock.

On the other hand, net commodity importers have smaller changes in overall GCI scores when prices are lower, but no individual pillar drives the change.

The analysis suggests that competitiveness will not come from currency depreciations alone. Increasing productivity and creating the conditions for new growth sectors, based on emerging business models and technologies in the context of the Fourth Industrial Revolution, requires making progress on the competitiveness agenda that many economies neglected during their commodity-led growth period. The Global Competitiveness Report should serve as a tool to achieve this change.

Note: Based on a constant sample of GCI coverage of net commodity exporters including Algeria, Argentina, Australia, Azerbaijan, Bahrain, Bolivia, Brazil, Cameroon, Canada, Chad, Chile, Colombia, Denmark, Guatemala, Iceland, Indonesia, Kazakhstan, Kuwait, Malaysia, Mauritania, Mexico, Mongolia, Mozambique, Namibia, Netherlands, New Zealand, Nigeria, Norway, Oman, Panama, Paraguay, Peru, Qatar, Russian Federation, Saudi Arabia, South Africa, United Arab Emirates, Uruguay, Venezuela, Vietnam, Zambia, Zimbabwe. * Each column corresponds to the change with respect to the previous GCI edition.

understood as the process of creating new products and services and finding new ways to produce things, are becoming increasingly important.

Innovation and business sophistication are more closely associated with income levels in general, and in emerging economies and commodity-exporting economies in particular, than they used to be. Figure 3 shows how, since 2010, for these two groups, GDP per capita has become more closely correlated with the GCI's technological readiness, business sophistication, and

innovation pillars than it is with the infrastructure, health and primary education, and market-related pillars (goods markets efficiency, financial market development, and labor market efficiency). These results illustrate how sources of productivity within firms and production units that are related to their ability to incorporate new technologies into their production processes, and that change the ways in which those firms and units perform tasks, are playing a larger role than investment in basic physical and human capital and well-functioning factor and goods markets,

Figure 2: Central bank assets and GDP growth economies with higher and lower GCI performance

Source: Authors' calculations based on IMF, International Financial Statistics (for central bank asset data) and IMF 2016c (for GDP growth data). Note: A subset of economies was considered for this exercise to match availability of central bank balance sheet information. Higher GCI performers include (in alphabetical order): Austria, Belqium, China, Estonia, Finland, France, Germany, Ireland, Japan, Luxembourg, the Netherlands, and the United States. Lower GCI performers include Brazil, Cyprus, Greece, Italy, Latvia, Lithuania, Malta, Portugal, the Russian Federation, the Slovak Republic, Slovenia, and Spain. Higher GCI economies are those with GCI 2007-2015 average score > 4.6; lower GCI economies are those with GCI 2007-2015 average score < 4.6.

Figure 3: Correlation between GDP per capita and lagged GCI pillars over time

Source: Authors' calculations based on IMF 2016c and UNCTAD.

Note: This graph builds two subindexes based on two groups of pillars: (1) infrastructure, health and primary education, goods market efficiency, labor market efficiency, and financial development; (2) technological readiness, business sophistication, and innovation. The graphs show the correlation between income per capita and the lagged value of these two subindexes. Each observation shows the correlation between GDP per capita in PPP terms (average over two years) and one-year lagged measures of the subindexes. The first subindex refers to investments in general physical and human capital and how well markets work on the one hand, and innovation and sophistication factors on the other. Emerging economies follow the IMF classification and net commodity exporters are identified using UNCTAD 2015 trade data. These are: Algeria, Argentina, Australia, Azerbaijan, Bahrain, Bolivia, Brazil, Cameroon, Canada, Chad, Chile, Colombia, Denmark, Guatemala, Iceland, Indonesia, Kazakhstan, Kuwait, Malaysia, Mauritania, Mexico, Mongolia, Mozambique, Namibia, Netherlands, New Zealand, Nigeria, Norway, Oman, Panama Paraguay, Peru, Qatar, Russian Federation, Saudi Arabia, South Africa, United Arab Emirates, Uruguay, Venezuela, Vietnam, Zambia, Zimbabwe.

frequently thought to be sufficient to reignite growth. It also shows how the price changes experienced since the end of the commodity cycle and faster technological change are creating incentives for firms and policymakers to engage in more innovative activities.

Declining openness is endangering future growth and prosperity

An open, trading economy generates incentives to innovate and invest in new technologies because firms are exposed to competition and new ideas and can benefit from the technology transfer that comes from

imports and foreign investment. At the same time, firms can benefit from larger markets abroad.8 However, the benefits of openness are at risk: protectionist measures, especially non-tariff barriers, have increased and global trade has not recovered since the global trade slowdown following the financial crisis.9 Figure 4 illustrates that, according to GCI data, economies in all income groups have become less open since 2007, driven mainly by non-tariff barriers, including increased legal and normative requirements. Figure 5 shows that economies that are open to foreign competition (as measured by the foreign competition subpillar of the GCI) are also

Figure 4: Openness in 2007-2008 and 2016-2017 editions, by income group

more innovative, suggesting the importance of openness for innovation. Box 4 explores the relationship between openness, innovation, and competitiveness in the context of cities' development and their integration into global value chains.

REGIONAL HIGHLIGHTS

Figure 6 shows the persistent competitiveness gaps between regions as measured by the GCI. This lack of convergence within and across regions represents an impediment to inclusive growth.

Faced with impending Brexit and geopolitical crises spilling over into the region, Europe finds itself in critical condition in many respects. Nevertheless, the regionwhich includes the EU28, Iceland, Norway, Switzerland, the Balkans, and Turkey-still performs above the global average in terms of competitiveness (4.72 average score in Europe versus an average score of 4.11 among the rest of the world; see Figure 7). This is driven by the performance of a group of regional champions, notably Switzerland, which leads the global rankings for the eighth consecutive year. The top 12 includes seven more European countries: the Netherlands (4th), Germany (5th), Sweden (6th), the United Kingdom (7th), Finland (10th), Norway (11th), and Denmark (12th).

Although the top European countries are pushing the frontier in almost all areas, there is wide dispersion in regional performance on several pillars. The largest gap is in the macroeconomic environment pillar, a reflection of the fact that the region has been recovering unevenly from the global financial crisis. Europe's median performance is weakest across the innovation indicators:

Figure 5: Correlation between openness and innovation, 2016-2017 edition

Source: Authors' calculations

Figure 6: Regional competitiveness comparison over time Average GCI score

Source: Authors' calculations

Note: A constant sample of 116 economies is included in all GCB editions.

Figure 8 shows that the region's countries are clearly divided, with a significant gap between the innovation assessment for Northern and Western European countries versus Central, Eastern, and Southern European ones. Although this gap has been a persistent challenge, there are some recent encouraging signs of convergence in certain dimensions.¹⁰

Accelerating innovation efforts will be crucial to maintain current levels of prosperity, and Europe can expect high returns from focusing its resources on nurturing its talent. Figure 9 zooms in on seven important human capital indicators. Among the basic education indicators, the regional gaps are most apparent for math and science education. On attracting and retaining

Non-EU Emerging: Albania, Macedonia (FYR), Montenegro, Serbia, Turkey Non-EU Advanced: Iceland, Norway, Switzerland,

Bosnia and Herzegovina was not included in this graph as it was not covered in the Global Competitiveness Index 2014–2015. The best country of each group is mentioned in the figure and is colored according to its group.

international talent, although one European country (Switzerland) achieves the top global scores, the average for the region as a whole is low; this does not bode well for the creation of a vibrant European knowledge economy. The United Kingdom is currently still the most attractive EU destination for talent, yet the Brexit vote has created significant uncertainty over the conditions under which workers from EU countries will be able to participate in the UK economy in the future. Moreover, university applications from the European Union could potentially drop amid uncertainty over prospective students' status and subsequent access to the UK job market (see Box 5 on the potential implications of Brexit: note that data presented in the Report were collected before the Brexit vote). Other European destinations also seem to be losing appeal. Indeed, some of the largest score drops for France compared to last year were registered for the "attract and retain talent" indicators.

With unemployment—and youth unemployment, in particular-still high across the region, Europe is leaving large numbers of its citizens behind. Yet good practice examples in this area exist on the continent, with countries such as Switzerland and Denmark striking a balance between high labor market flexibility and strong social safety nets. Table 3 in Appendix B gives an idea of the extent of catching up on labor market efficiency that many European countries will have to do over the coming years; note that the level of inclusion

Box 4: Competitive cities and global value chains: Connections between two powerful drivers of growth, productivity, and jobs

In its white paper on Competitive Cities and their Connections to Global Value Chains, the Global Agenda Council on Competitiveness identified policy elements that can be put in place at the city level to upgrade products and processes and foster participation in international production networks. Listed below are some of its main findings:

- Inserting the productive sector into global value chains (GVCs) can be central to a city's competitiveness. GVCs provide a vehicle for cities to take part in the global economy through trade and investment; they can contribute to making cities vibrant magnets for innovation, productivity increases, and employment.
- · Participating in GVCs requires a sustained effort by cities to re-invent and reposition themselves. This participation is not a matter of making just one major push to insert the city's productive sector into GVCs. City leaders need to scan the global and local economic horizon to identify initiatives that can most enable their cities to catch the momentum of economic forces.
- · Creating robust soft connectivity advantages to build on hard connectivity is essential to improving participation. Access to a qualified and educated labor force, innovation and research and development policies conducive to upgrading, digital infrastructure to deepen connectivity, and trade facilitation and logistics policies to

- expedite movements of people are key elements of successful GVC participation.
- · Successful cities have flourished in a context of openness. Open trade and investment policies pave the way for connecting cities to the opportunities presented by international markets; a city open to talent from other regions and from abroad enhances its attractiveness to GVCs.
- · Understanding how GVCs operate and how investors select their investment destinations, with a focus on inclusiveness and flexibility, should guide policymakers' competitiveness decisions. City leaders can maximize the impact of their investments in competitiveness by addressing bottlenecks and challenges that are particularly relevant in order to attract and facilitate the operation of GVCs, as well as to foster value addition in the city. Inclusiveness by opening opportunities to all members of society and flexibility to quickly adapt to constant changes in production networks determine the sustainability of successful competitive cities.

Box 5: The Brexit vote: What impact will it have on competitiveness?

On June 23, 2016, the United Kingdom voted to leave the European Union. At the time of writing, Article 50 of the Lisbon Treaty—which governs the withdrawal of a member state from the Union-had not yet been triggered and a timeline for the exit process had not been fixed. Nevertheless, economic repercussions of the vote are already being felt and will probably be amplified once actual treaty changes are implemented (note that the data for the GCI were collected before the vote and thus do not yet reflect the new situation). Before the Brexit vote, the economic recovery in Europe was progressing; this progress was backed by stronger internal demand fueled by low oil prices, accommodating monetary policy, and ongoing job creation. The vote triggered an immediate depreciation of the British pound and a drop in the price of UK and euro-area risky assets, and has led to downward corrections of the short- to medium-term growth outlook for the United Kingdom as well as the rest of the European Union.¹

Although we do not know yet what the exact impact of Brexit will be, economic repercussions of the leave vote are likely to fall into two categories: in the short run, before any modifications of the legal framework have taken place, economic outcomes are affected by an increase in uncertainty over the legal conditions that will eventually prevail. This increased uncertainty has macroeconomic consequences, reducing investment, consumption, and foreign trade as consumers and investors become more cautious. Projections by the European Commission yield a downward revision of the 2017 growth forecast by 1.00 to 2.75 percentage points for the United Kingdom and 0.25 to 0.50 percentage points for the European Union (the range reflects different assumptions about the change in the risk premium that captures the severity of the shock).² All scenarios assume a 15 percent depreciation of the pound, which should improve UK export performance; nevertheless, the net effect on growth is predicted to be negative. Because uncertainty is holding back investment and reducing the attractiveness of the United Kingdom for talent (both students and workers), important drivers of competitiveness are expected to be affected by the leave vote before any treaty changes have taken place.

In the longer run, economic repercussions will be emanating from changes to the four freedoms guaranteed by the European Union (the free movement of people, goods, services, and capital) as well as the partial or full withdrawal of the United Kingdom from the EU budget. The key long-run channels through which the exit will be transmitted are thus increases in the cost of trade, investment, and movement of labor, which will all eventually be reflected in the goods and labor market efficiency as well as market size pillars of the Global Competitiveness Index (GCI). Most projections have focused on the immediate trade and investment effects of Brexit. The three most plausible scenarios for governing the United Kingdom's economic relations with the European Union post-Brexit are (1) to adopt European Economic Area (EEA) membership following the Norwegian model (the most liberal option in terms of the four freedoms), (2) to adopt European Free Trade Association (EFTA) membership

following the Swiss model, or (3) to fall back on World Trade Organization (WTO) rules. There is a consensus among leading economists that the impact on GDP will be negative under all scenarios that reduce any or all of the four freedoms. The largest negative impact—of -6.3 to -9.5 percent of UK GDP (in 2030)—is predicted under a scenario that models impacts on trade, productivity, and budget with EEA/EFTA parameters in a dynamic setting.³ Static, tradeonly projections by the same authors put the economic cost at 1.3 to 2.6 percent of 2030 GDP for the United Kingdom.⁴ UK government projections assume changes in budget, trade, foreign direct investment, and productivity and find losses for the UK economy ranging from 3.8 percent (under the EEA/ Norwegian model) to 7.5 percent (using the WTO model) of GDP in 2030.⁵ Since geographic proximity is an important factor in determining trade flows, simply shifting trade to other (necessarily more distant) markets is unlikely to provide a quick fix.6

Additional effects on growth and competitiveness are likely to be felt in terms of innovation impact if the country becomes less accessible for international talent. In order to cushion the impact of the withdrawal of EU funding for basic research, the UK Treasury has pledged to guarantee funding for projects that are currently funded by the EU.7

Although the majority of those mechanisms contribute to weakening the UK economy, one source of potential benefits of leaving might be regulatory changes that shift the regime in a way that is optimal for the United Kingdom; currently, a significant part of the UK economy is subject to a regulatory regime that reflects a compromise between the preferences of 28 countries. However, no clear plan for such regulatory changes that would allow for a forecast of economic impact has been outlined.

Although it is clear that various drivers of competitiveness will be affected by the leave vote, the size of the ultimate effect of Brexit on productivity itself remains difficult to predict. Reversing trade liberalization is known to have negative productivity effects because it loosens competitive pressures, giving more leeway to less-productive firms. The ultimate productivity impact will depend to a large extent on the level of competition that prevails in the UK economy after Brexit.

A distributional analysis of the longer-term consequences of Brexit suggests that the costs will mostly fall on those with middle incomes, although the poor will not be spared from its impact.8

achieved by reforms will depend heavily on the details of implementation.

A more detailed assessment of the European competitiveness landscape is currently being undertaken in the context of the Europe Inclusive Growth and Competitiveness Lab, a joint initiative between the Forum, the European Investment Bank, and Bruegel (see Box 7).

Eurasia

Eurasia's competitiveness performance has been stable overall, although most economies in the region face challenges related to the fall in commodity prices (Figure 10), volatile exchange rates, recession in the Russian Federation and Ukraine, and the slowdown of the Chinese economy. These shocks have affected competitiveness in two major ways: all Eurasian economies except Georgia have seen the value of their exports fall, reducing their total market size; and falling tax and royalties revenues have increased government deficits and public debt.

On average, the region went into recession in 2015 and its growth is expected to remain negative for 2016. In many cases, currency devaluation and inflation especially in economies dependent on commodity exports—have also contributed to a volatile economic environment. Financial sectors are under stress in at least half of Eurasian economies, with banks becoming less liquid and reducing firms' access to financeespecially in Moldova (which has been affected by banking scandals), the Russian Federation, Tajikistan, and Ukraine.

Regional geopolitics continues to cause uncertainty, instability, and declining perceptions of security, as reflected in the institutions pillar of the GCI. Concerns include the Armenian-Azerbaijani clashes in Nagorno-Karabakh; the still-unresolved situation in Ukraine; and sanctions against the Russian Federation's financial sector, which contributed to the increased stress on this sector regionally.

Nonetheless, the region has improved other factors of competitiveness, including technological readiness, education, and institutions. With mineral resources accounting for over 65 percent of the region's exports, microeconomic fundamentals are necessary to lay the foundation for much-needed diversification of economic activity.11 Eurasian economies still need to accelerate progress to close the gaps with the most advanced economies in innovation capacity and technological readiness. Upgrading transport infrastructure remains another priority.

Regional competitiveness differences remain wide, with Azerbaijan (37th) and the Russian Federation (43rd) again the top performers. Despite headwinds from the drop in oil prices that impact their macroeconomic environment, both economies improve their performance

Figure 10: Share of minerals in exports and macroeconomic environment in Eurasia, 2016-2017 edition Percent

Source: Authors' calculations: International Trade Centre

slightly, mainly driven by better and more widespread education and reforms to improve the business environment and goods market efficiency. Some progress has been made in curbing corruption, which nevertheless remains a problematic factor for doing business in both countries.

The most improved Eurasian economies are Georgia (up seven places at 59th) and Tajikistan (up five at 77th).12 In both countries GDP is expected to grow by over 2.5 percent in 2016—below the average for the past decade, but more than other Eurasian countries. Tajikistan starts from a lower base and its positive performance this year is mainly driven by better ground transport and electricity infrastructure, less red tape to start a business, and slightly improved institutional environment.

Kazakhstan (53rd), Moldova (100th), and the Kyrgyz Republic (111th) decline in the rankings and register scores lower by 2 to 3 percent, dropping eight or more positions. Kazakhstan has lost ground almost exclusively as a result of the worsened situation of public finance, linked to the loss of oil export revenues. Despite not being oil exporters, Moldova and the Kyrgyz Republic have been severely hit by the recession in the Russian Federation and Ukraine, which has reduced their economic activity, increased inflation, and considerably worsened public finances.

East Asia and Pacific

East Asia and Pacific is characterized by great diversity. The region's 18 economies covered in the GCI 2016-2017 span a large part of the development ladder, from Cambodia to Singapore, and include three of the world's 10 largest economies: China, Japan, and Indonesia. The region's emerging economies, led by China, have been supporting the modest global recovery since the global financial crisis. These economies accounted for almost

Figure 11: GCI scores of East Asia and Pacific economies

Source: Authors' calculations.

Note: The GCI 2016-2017 rank is reported in parentheses. Score differences were rounded to the nearest decimal, but exact values were used for representation. The green and red bars indicate, respectively, gains and losses between the two editions

two-fifths of global growth last year, more than twice the combined contribution of all other emerging regions.¹³ Today, global economic prospects look less favorable as a result of China's slowdown, anemic growth in Japan and other advanced economies, and persistently low commodity prices undermining the growth and public finances of several economies in the region—notably Indonesia and Mongolia.¹⁴

The GCI results reveal contrasts in the region. Its advanced economies continue to perform strongly. Led by Singapore, 2nd overall behind Switzerland for the sixth consecutive year, these economies all feature in the top 30 of the GCI rankings. Losing ground since last year, Japan ranks 8th (down two) and Hong Kong SAR ranks 9th (down two). New Zealand advances three positions to 13th, while Chinese Taipei is up one notch to 14th. Further down, Australia (22nd) and the Republic of Korea (26th) both improve their scores but their positions are unchanged.

Among emerging economies, Malaysia (25th) continues to lead the region, despite losing some ground this year following six years of improvement. China remains steady at 28th for the third year in a row.

Reflected in the evolution of the GCI score since the 2007-2008 edition, the overall competitiveness trends for the region are overwhelmingly positive: 13 of the region's 15 economies covered since 2007 achieve a higher score today, with Cambodia, China, and the Philippines posting the largest gains (see Figure 11). The only exceptions are Korea and Thailand, though for the latter the loss has been small and from a high base. There are signs, however, that the generalized upward trend is tapering off somewhat: for half of the economies in the

region, the score is either stable (score difference of less than 0.01 point) or lower than last year. Still, the contrast with South Asia remains very stark. Six of the nine East Asian emerging economies feature in the top half of the GCI rankings; among the six South Asian economies covered, only India achieves this feat.

The region's advanced economies need to further develop their innovation capacity. Japan and Singapore are the only economies in the region among the world's top 10 innovators, ranking respectively 8th and 9th in the innovation pillar. Japan, Korea (which has dropped from 8th to 20th in the pillar since 2007), and to a lesser extent Chinese Taipei (11th), have experienced a steady erosion of their innovation edge since 2007. Meanwhile New Zealand (23rd), although it has improved significantly since 2007, Australia (26th), and Hong Kong (27th) remain far behind the world's innovation powerhouses.

Since 2007, most emerging economies have improved on the basic drivers of competitiveness (i.e., on the first four pillars of the GCI)—often markedly, though also often from a low base. With the exception of Malaysia and Thailand, these economies have made major strides in improving governance, including in tackling corruption. All of them except Thailand have also made significant progress in terms of transport infrastructure, which has traditionally been a major constraint to growth for these economies. A similar generalized upward trend is seen in health and basic education. In the past decade, the situation has greatly improved in this area—except in Indonesia, which achieves some of the worst health outcomes outside sub-Saharan Africa. On the macroeconomic front, the

Figure 12: Changes in the drivers of competitiveness in South Asia, 2007-2016 edition

Change in pillars' contributions to South Asia's* competitiveness between 2007 and 2016 Change in pillar score Pillar score in 2016 0.41 3.56 Higher education and training 0.04 0.04 0.27 4 66 Market size Health and primary education 0.03 0.52 5.29 Technological readiness 0.02 0.15 2.84 Goods market efficiency 0.02 0.02 4 12 Innovation 0.02 0.15 3 28 Infrastructure 0.33 0.02 3.13 Business sophistication 0.02 -0.13 3.79 Labor market efficiency 0.00 -0.25 3.64 Financial market development 0.00 -0.41 3.87 0.27 4.58 Macroeconomic environment -0.01Institutions -0.02 0.13 3.69

Source: Authors' calculations.

Note: The contibution of each pillar to the region's overall competitiveness level varies according to the changes in both its score and weight. The latter depends on whether countries have moved across different stages of development

situation has also improved almost everywhere, with inflation at a 10-year low in most economies. The fiscal situation is also relatively sound, with most economies posting deficits lower than 3 percent. The notable exception is Mongolia, where the macroeconomic situation remains worryingly volatile.

Despite positive developments, there is no room for complacency. All emerging economies in the region have achieved middle-income status, and to sustain growth they now need to pay increasing attention to the more complex areas of competitiveness, where their shortcomings are many. Digital infrastructure and ICT uptake are showing significant progress, but becoming more innovative is also a pressing imperative—especially for Malaysia, China, and Thailand-if they are to avoid the middle-income trap. 15

South Asia

South Asia continues its upward trend and competitiveness improves in most economies in the region, which is experiencing positive economic momentum, and in 2016 is set to grow more quickly than China for the first time in more than 20 years. Over the past decade, the subcontinent has focused on improving overall health and primary education levels and upgrading infrastructure, areas of particular importance for future diversification and preparedness given the resource-driven nature of the regional economies.

In the health and primary education and the infrastructure pillars, South Asia's average score has increased by 0.5 and 0.3 respectively since 2007, but infrastructure remains the region's second weakest pillar, just after technological readiness. Investment in

these areas will be vital to fully unlock economic growth. As they move up the development ladder, it will also be increasingly important for South Asian economies to establish competitiveness agendas to improve the functioning of their labor and financial markets, which have deteriorated over the last 10 years (Figure 12).

The region remains diverse, with a core of three heavyweight economies-India, Pakistan, and Bangladesh-surrounded by smaller ones such as Bhutan, Nepal, and Sri Lanka, each with its own peculiarities and unique development path (Figure 13). Since 2007, the gap between the best- and worstperforming economies in the region has increased in some of the drivers of competitiveness, mostly as a result of the deteriorating situation in Pakistan. The quality of infrastructure has improved significantly (although from low levels) in India, Bangladesh, and Sri Lanka, while it stalls in Nepal and deteriorates in Pakistan. Pakistan is also the only economy that fails to improve its macroeconomic environment and health and primary education levels, falling behind other South Asian economies. Financial market development remains poor across the entire region, as does technological readiness; this last area improves significantly only in Bangladesh and Sri Lanka, which overtook India to become the best performer in this pillar in the region.

India leads the group of South Asian economies, climbing to 39th with improvements across the board, including institutions and infrastructure (42nd and 68th), which have been particularly important in increasing overall competitiveness (see Box 6).

The most advanced economy in the region, Sri Lanka, slips three positions to 71st, but with a stable

^{*} Based on a constant sample: Bangladesh, India, Nepal, Pakistan, and Sri Lanka.

Figure 13: GCI score range across the 12 pillars in South Asia, 2016–2017 edition Score (1-7)

GUI

Source: Authors' calculations. Note: China is included for reference.

Box 6: Ten years of competitiveness in India

India's GDP per capita in PPP terms almost doubled between 2007 and 2016, from US\$3,587 to US\$6,599. Growth slowed after the 2008 crisis, hitting a decade's low in 2012–13. This experience triggered India to rethink its policies and engage more firmly in the reforms necessary to improve its competitiveness. Growth rebounded in 2014 and last year surpassed that of China, making it the fastest-growing large emerging market in that year.

India's competitiveness score stagnated between 2007 and 2014, and the economy slipped down the GCI rankings. Since the new government took office in 2014, India climbed back up the rankings to 39th in this edition of the *Report*, from 48th in 2007–2008. What has made India so successful in recent years?

The overall trend masked some diversity over the years on the different pillars, as shown in Figure 1. For example, health and basic education improved throughout the decade.1 Improvement in infrastructure, by contrast, was small and faltering during most of the period, but picked up after 2014 when the government increased public investment and sped up approval procedures to attract private resources. The institutional environment deteriorated until 2014, as mounting governance scandals and seemingly unmanageable inefficiencies saw businesses lose trust in government and public administration, but this trend was also reversed after 2014. Macroeconomic conditions followed a similar path, as India managed only in recent years—thanks also to the drop in commodity prices—to keep inflation below the target of 5 percent while rebalancing its current account and decreasing public deficit. Financial market development has also improved since 2014, but-unlike the case of institutions and

Table 1: Change in pillars' contribution to India's competitiveness between 2007 and 2016

Pillar	Weighted contribution to change in GCI	Change in pillar score	Pillar weight	Pillar score 2016
Health and primary education	0.09	0.62	15%	5.54
Infrastructure	0.09	0.59	15%	4.03
Macroeconomic environment	0.05	0.34	15%	4.55
Market size	0.02	0.27	6%	6.43
Institutions	0.00	0.03	15%	4.36
Innovation	0.00	0.15	3%	4.05
Labor market efficiency	0.00	0.02	6%	4.10
Higher education and training	0.00	0.00	6%	4.12
Technological readiness	-0.01	-0.18	6%	2.99
Business sophistication	-0.01	-0.43	3%	4.39
Goods market efficiency	-0.02	-0.26	6%	4.39
Financial market development	-0.03	-0.52	6%	4.41

Source: Authors' calculations.

the macroeconomic environment—not enough to recover to 2007 levels.

Table 1 illustrates which pillars improved or deteriorated over the 10 years from 2007 to 2016. Thanks to the 2015 and 2016 rebound, India's overall competitiveness score in this period increased by 0.19 points. The two most significant improvements are in infrastructure and in health and primary education: for example, India almost halved its

(Cont'd.)

score. After years of conflict, the country needs to concentrate on triggering the efficiencies that will drive further growth—for example, by restructuring the labor market and investing in technological readiness, where it lags significantly behind economies at a similar stage of development. The two Himalayan economies, Bhutan (97th) and Nepal (98th), both improve their positions this year, by eight places and one place, respectively. Infrastructure and connectivity are bottlenecks for both economies but, thanks to heavy investments in hydroelectric power, Bhutan can rely on a highquality electricity supply (41st). Nepal boasts the best

rate of infant mortality (62 per 1,000 in the 2007–2008 edition of the GCI versus 37.9 today). Life expectancy increased to 68, up from 62 10 years ago, while primary education has become almost universal (up to 93.1 percent from 88.8 percent). Macroeconomic environment is another basic requirement where India's performance has improved significantly (+0.34).2

At the other end of the spectrum, financial market development is the pillar most dragging down India's competitiveness compared to 10 years ago. Here the efforts of the Reserve Bank of India have increased transparency in the financial market and shed light on the large amounts of nonperforming loans, previously not reported on the balance sheets of Indian banks. Banks have not yet found a way to sell these assets, and some need large recapitalizations.

The efficiency of the goods market has also deteriorated, resulting from India's failure to address long-running problems such as varying goods and services tax (GST) levels within the country (this is set to finally change as of 2017 if the Central GST and Integrated GST Bills currently in Parliament are fully implemented). Another area of concern is India's stagnating performance on technological readiness, a pillar on which it scores one full point lower than any other. These three pillars will be key for India to prosper in its next stage of development, when it will no longer be possible to base its competitiveness on low-cost, abundant labor. Higher education and training has also shown no improvement.

What areas should India prioritize today? India has made significant progress on infrastructure, one of the pillars where it ranked worst. As the country closes the infrastructure gap, new priorities emerge. The country's biggest relative weakness today is in technological readiness, where initiatives such as Digital India could lead to significant improvements in the next years. India outperforms countries in the same stage of development, mostly those in sub-Saharan Africa, in all pillars except labor market efficiency.

Even on indicators where India has made progress, comparisons with other countries can be sobering: although life expectancy has increased, for example, it is still low by global standards, with India ranking only 106th in the world; and while India almost halved infant mortality, other countries did even better, so it drops nine places this year to 115th. Huge challenges still lie ahead on India's path to prosperity.

Notes

- The deterioration in health and primary education performance reported between 2008 and 2009 was the result of a revision of previously available data on the incidence of malaria, which was corrected upward.
- The adoption of new PPP estimates by the IMF in 2014 also contributed to the increase in the measure of market size used in

macroeconomic environment in the region and, after significant recent improvement, the second highest level of health and primary education.

Pakistan trails the group of South Asian economies. Its upward trend of recent years continues with an advance of four places to 122nd, although its score is still below the 2007 level. The climate of instability during this period has surely weighed down the country's economic development.

Latin America and the Caribbean

After almost a decade of strong growth following the global financial crisis, growth rates in the region have fallen and several countries are now heading into recession. The end of the commodity super-cycle resulted in a drop in export values for major commodityexporting countries, including Brazil, Venezuela, Colombia, Ecuador, and Argentina. The subsequent fall in global trade has also hit demand for manufacturing exports, further reducing the value of exports across most of the region. The result of this negative terms-oftrade shock has been a large trade deficit, producing current account deficits and government budget deficits.

Despite the relative depreciation of the region's floating currencies against the US dollar, exports have not recovered. This makes evident the magnitude of the competitiveness challenges in the region, where productivity has been falling, on average, during the last 20 years.

The top performing country in the region remains Chile (33th), increasing two places in the rankings, followed by Panama (42nd) with an improvement of eight positions. Costa Rica falls slightly to 54th rank, and Mexico (51st) improves by six positions.

The overall range of scores in Latin America and the Caribbean remains large, with the worst-ranked in 130th place and the best-ranked in 33rd place. Within pillars, the largest regional gaps remain in the macroeconomic environment, reflecting the magnitude of the commodity and investment shock on commodity-exporting countries, and size of domestic markets. We also observe an increased dispersion within the institutions pillar, driven by the ethics and corruption subpillars and recent scandals in the region.

Figure 14 shows the best, worst, median, and mean performer in the region—and the best global performer on each of the 12 pillars of the GCI. This allows us to understand the sources of regional inequality driving productivity and growth differences, as well as the gap between the regional and global top performers. Although Latin America and the Caribbean has made progress on average, large gaps remain in all pillars. The largest gaps with the best world performer are in business sophistication and innovation, where Panama and Costa Rica lead the region. Other large gaps are in infrastructure, institutions, and labor market efficiency.

Panama, the largest upward mover in the overall Index this year, leads the region in macroeconomic environment, goods market efficiency, financial

Figure 15: Performance of net oil exporters vs net oil importers in Latin America and the Caribbean, 2016-2017 edition

Source: Authors' calculations

Note: Net oil exporters determined using UNCTAD Trade Data. Oil-exporting countries included are Colombia, Ecuador, Mexico and Venezuela. Oil importing countries are Barbados Belize, Bolivia, Brazil, Chile, Costa Rica, Dominican Republic, El Salvador, Guatemala, Guyana, Haiti, Honduras, Jamaica, Nicaragua, Panama, Paraguay, Peru, Suriname, Trinidad and Tobago, Uruguay,

market development, and business sophistication. Costa Rica leads in health and primary education and innovation. Uruguay leads the institutions pillar, and Chile leads higher education and training. Barbados tops the regional rankings in infrastructure, labor market efficiency, and technological readiness, despite having the smallest domestic market.

Figure 15 compares the results of oil-exporting countries and oil-importing countries in the region. Oil-exporting countries fare worse in macroeconomic performance, and they perform worse than oilimporting countries in institutions, infrastructure, goods market efficiency, labor market efficiency, and financial development. The commodity boom masked the need to make urgent progress on pending competitiveness gaps. Large inflows of FDI, prices of oil above US\$100, and the resulting export and government revenue increases all reduced the urgency of advancing on a competitiveness agenda that would allow new growth sectors to emerge. Oil-exporting countries in the region are now facing the consequences of unfinished work on all fronts. They also have the opportunity to respond with renewed competitiveness agendas (for an example see Box 7 on competitiveness labs).

North America

The United States ranks 3rd for the third consecutive year, while Canada ranks 15th. However, the evolution of how the two countries rank on various pillars sheds light on the forces shaping competitiveness among advanced economies at the forefront of the Fourth Industrial Revolution.

Figure 16: Performance of North America and OECD countries, 2016-2017 edition

Source: Authors' calculations.

Note: OECD = Organisation for Economic Co-operation and Development.

Both the United States and Canada outperform the Organisation for Economic Co-operation and Development (OECD) country average overall and on most pillars, although the OECD average beats the United States in areas such as macroeconomic performance and health and primary education (Figure 16). The United States lags behind Canada in the quality of institutions, macroeconomic environment, and health and primary education. Canada's largest disparities with OECD countries are in business sophistication and innovation. The large domestic market in the United States represents a major source of competitiveness advantage over other advanced economies.

Since 2007, the United States has been falling behind both in absolute and relative terms in infrastructure, macroeconomic environment, and goods market efficiency. It has improved, however, on health and primary education, higher education and training, and especially technological readiness, one of the most essential pillars for taking advantage of new technologies.

Canada, on the other hand, has improved marginally in all efficiency enhancers, with markets for goods, labor, capital, and human capital remaining among the bestranked of the OECD countries. However, Canada lags behind on innovation and business sophistication, which are especially central for advanced economies.

In the United States, innovation and business sophistication have improved; in Canada, they have deteriorated and could be slowing down productivity improvements. However, the business community in

Box 7: Competitiveness Labs

The Global Competitiveness Index seeks to serve not only as the foremost benchmarking tool to track competitiveness, but also as a tool to facilitate the identification of priority areas and the design of public-private collaboration on agendas to make progress in those areas.

The World Economic Forum strives to contribute to this process of closing competitiveness gaps through a model of public-private collaboration toward actionable agendas called the Competitiveness Labs. This box describes the two ongoing Labs in Latin America and Europe.

Latin America

Based on The Global Competitiveness Report (GCR) series, the Competitiveness Lab project has been exploring how to address key competitiveness challenges in Latin America, specifically Colombia and Mexico. The Lab promotes publicprivate collaboration, by bringing together representatives from each sector to devise actionable, long-term competitiveness agendas.

The Competitiveness Lab project began at the World Economic Forum Annual Meeting at Davos in 2014, with a broad mandate from participants from the private and public sectors in Latin America. Together with Strategic Partner Deloitte and a high-level steering board, the Forum built on the GCR analysis to identify the region's main competitiveness gaps and produce an Insight Report with a set of policy recommendations. The report, Bridging the Skills and Innovation Gap to Boost Productivity in Latin America,1 was presented during the World Economic Forum on Latin America 2015. It led to requests for a second phase, to help implement the policy recommendations at the country level.

The Lab methodology consists of an initial workshop, facilitated by the Forum, which convenes high-level representatives from government, the private sector, and civil society to select the most pressing policy recommendation from the Insight Report. Workshop participants form a Steering Committee to be the Lab's main governance and decision-making body. A Working Group, with representatives from government and the business community, writes a proposal with help from Forum's technical secretariat.

Both Colombia and Mexico chose to focus on the need for new public-private financial schemes for innovation. Although both Labs are currently at the stage of completing recommendations to their Steering Committees, the process has already resulted in a more positive dynamic between relevant agencies in government and the private sector. A forthcoming report will document lessons learned, with a view to replicating the experience and contributing to more vigorous, evidence-based and project-driven competitiveness agendas in the region.

Europe

As in Latin America, the Europe Inclusive Growth and Competitiveness Lab aims to support the design, launch, and implementation of actionable agendas for publicprivate collaborations to increase competitiveness and inclusive growth.² The Lab is a joint initiative of the Forum, the European Investment Bank, and the European think tank Bruegel. Drawing on the three partner organizations' established frameworks and the latest academic research, its first phase will run from January 2016 to January 2017.

In the project's first phase, the partners are currently analyzing the inclusive growth and competitiveness situation in Europe to inform a white paper that will identify priorities. The second phase will implement concrete public-private partnership opportunities at the EU and subregional levels and/or the industry level. The Lab has a strong, cross-cutting focus on the role of digitalization in the regional economy; it considers reallocating resources to invest in innovation and entrepreneurship to be a key driver for change, and deeper integration of the European single market to be a key catalyst.

The Lab will build on, strengthen, and engage the World Economic Forum's multi-stakeholder communities through sustained dialogue to support informed decision-making on transformation processes in Europe. Mindful of the shortterm challenges currently confronting the continent, the Lab is focusing on longer-term drivers of competitiveness and inclusive growth—and providing thought leadership on how to unleash these drivers through public-private action.

Notes

- The full report is available at https://www.weforum.org/reports/ bridging-skills-and-innovation-gap-boost-productivity-latin-america-competitiveness-lab/.
- The details of this methodology will be available in a forthcoming World Economic Report on the Latin America Competitiveness

the United States is increasingly concerned about basic determinants of competitiveness such as infrastructure.

Middle East and North Africa

The Middle East and North Africa region continues to experience significant instability in geopolitical and economic terms as spillover effects from the conflicts in Libya, Syria, and Yemen are undermining economic progress in the entire region.

Instability is also being created by the uncertain future of energy prices after recent falls, which affect the region's countries in different ways. Oil-exporting

countries—which include Algeria (87th), Bahrain (48th), the Islamic Republic of Iran (76th), Kuwait (38th), Oman (66th), Qatar (18th), Saudi Arabia (29th), the United Arab Emirates (16th), and Yemen (138th)—are experiencing lower growth, higher fiscal deficits, and rising concerns about unemployment. Growth in Gulf Cooperation Council (GCC) economies averaged 5.2 percent between 2000 and 2012, but fell to 2.5 percent in 2015. The forecast for 2016 is also 2.5 percent, 16 and rising oil supplies are expected to keep prices low and limit growth expectations for the coming years.

With a growing youth population, creating employment opportunities in the private sector is crucial to ensuring a prosperous future: the United Nations estimates that 3.8 million people will enter the labor force in the region by 2021.¹⁷ This creates pressure for structural economic reform in order to diversify and increase productivity.

Although the region's oil-exporting countries are diverse in terms of their competitiveness (see Figure 17), two commonalities can be observed. First, despite recent privatization efforts, most national economies remain state-dominated (in particular in the extractive industries) and not sufficiently diversified. In Saudi Arabia, for example, the state's stake in state-owned enterprises amounts to 19.8 percent of GDP; in the UAE, this is 21.8 percent; and in Qatar, 23.1 percent. The oil sector remains predominant in many countries, with the oil GDP as share of total GDP ranging from 19.5 percent in Yemen to 62.9 percent in Kuwait. 18 Competition remains constrained throughout the region: the level of domestic competition and openness to foreign trade and investment remains below OECD levels for most countries. Efficiency and productivity could be improved by continued privatization, reducing regulatory barriers to entry for domestic companies, and making business environments more welcoming for foreign direct investment and more conducive to the growth of smalland medium-sizes enterprises.

Second, as the Fourth Industrial Revolution gathers pace, putting in place innovation, technological readiness, and health and primary education will be increasingly important. Oil-exporting countries in the Middle East and North Africa region have room for improvement in these areas, which should go hand in hand with diversification away from the energy sector. The most competitive economy in this group, the United Arab Emirates, is also the most diversified and has made great strides toward improving technological readiness and innovation since 2011, moving from 30th to 18th and from 28th to 25th on the related pillars of the GCI, respectively.

Growth in the region's oil-importing Arab economies-Egypt (GCI rank of 115th), Jordan (63rd), Lebanon (101st), Morocco (70th), and Tunisia (95th)has also slowed, down from 5.4 percent on average between 2000 and 2012 to 1.9 percent in 2015, often as a result of spillover effects from regional conflict.¹⁹ Key priorities for these countries continue to be fostering employment and making economies more inclusive to meet the population's demands for higher living standards and economic opportunities. This will require reforms that aim to strengthen the private sector:

Figure 18: GCI score range across the 12 pillars in sub-Saharan Africa (SSA), 2016-2017 edition Score (1-7)

Source: Authors' calculations.

Note: China, the region's main trading partner, is included for reference.

promoting competition, reducing red tape, and making labor markets more flexible are key challenges across all countries. The drop in oil prices creates a window of opportunity to tackle long-standing energy subsidies, which would allow for more competitiveness-enhancing investments and help to stabilize the macroeconomic environment, which remains strained in most countries. Although most of the oil-importing countries in the region are facing declining or stagnating competitiveness, Israel (24th) improves by three positions as it continues to build on its positioning as one of the most innovative economies in the world (2nd).

Sub-Saharan Africa

Sub-Saharan Africa's competitiveness has slightly weakened year on year, mainly as a consequence of deteriorating macroeconomic environments across the region (Figure 18). Public finance has been put under stress by economic slowdowns among trading partners and persistently low commodity prices, which affect the commodity-exporting countries. These factors help to explain why growth has dropped from over 5.0 percent two years ago to only 3.5 percent in 2015 and is projected to fall further, to 3.0 percent, in 2016.

Short-run pressure on public funds may have longlasting effects on African economies by reducing muchneeded investments in infrastructure and education, while higher uncertainty about country financial risks could shrink private investments. Slower growth and

falling commodity prices have already started to affect the African financial sector, reducing liquidity and tightening credit conditions. As a result, although the banking system remains generally solid, business leaders rate the banking environment as worsening in two-thirds of the countries assessed by the GCI, and access to finance is mentioned more often as a problematic factor for doing business in the region.

Improvements have been achieved in the business environment, information and communication technologies, and infrastructure, but these have been insufficient to improve overall productivity levels, as reflected by a substantially stable GCI performance at the regional level (this changed by less than 1 percent compared to the last edition). Continued progress in these areas will be challenging, given low commodity prices and low growth trajectories in advanced and emerging economies—but progress is necessary, as these countries are among the areas where Africa still has the largest disparities with the world's most competitive economies. Improving infrastructure, technological readiness, and health and primary education continue to be sub-Saharan Africa's main priorities as the region seeks to reap the demographic dividend by creating more employment opportunities for the millions of youth who will enter the labor market every year (Figure 19).

Country performances in sub-Saharan Africa vary widely, reflecting economic and political conditions.

Not all commodities have faced declining prices and demand: economies relying on oil and gas have been harder hit than those exporting gold or cotton.²⁰ Droughts have also impacted agriculture unevenly, affecting the Horn of Africa and Southern Africa more severely than other areas. Politically, 2016 has been an election year in a number of countries (notably Cape Verde, the Democratic Republic of Congo, Ghana, and Uganda), increasing uncertainty in the business environment. Health and security situations have impacted the fundamentals of competitiveness in some countries, especially with continuing Ebola cases in Liberia and Sierra Leone and terrorism attacks in parts of West Africa, namely Côte d'Ivoire, Cameroon, and Nigeria.

Mauritius (ranking 45th) and South Africa (47th) remain the region's most competitive economies, climbing two places and one place, respectively. South Africa maintains its regional leadership in terms of financial markets, competition, infrastructure, and education, despite recent challenges from exchange rate volatility, governance concerns, and policy uncertainty, as reflected in the institutions pillar.

Five sub-Saharan Africa economies improve their GCI rankings by three to six positions and their scores by 2 percent or more: Rwanda (52nd), Botswana (64th), Ghana (114th), Tanzania (116th), and Sierra Leone (132nd). Ghana, which improves the most, advances in labor market efficiency; along with Rwanda and Tanzania, it also strengthens its macroeconomic environment and improves its infrastructure, education, and institutions. Sierra Leone's five-place rise is mainly thanks to recovering health conditions and infrastructure, while Botswana also gains five places thanks to a better performance in infrastructure, higher education, and goods market efficiency.

The region's biggest losers this year are Zambia (118th), down an exceptional 22 positions, and Côte d'Ivoire (99th), down eight places-although its score fell by less than 2 percent. Côte d'Ivoire's economy is growing at a rate of more than 8 percent, and its decline in ranking mainly reflects political uncertainty in an election year, growing terrorism concerns after the Grand-Bassam shooting in March, and concern about institutions. Zambia's decline is driven by difficulties in public finance and a lower performance in institutions, infrastructure, and goods market efficiency. The country has been affected this year by power shortages, low copper prices, and political uncertainty ahead of August's elections.21

ECONOMY HIGHLIGHTS

This section discusses performance highlights for selected economies, including the top 10 most competitive and G20 economies outside the top 10.22 Economies are listed in rank order. The performance of

Figure 19: Working age population, regional trend Working age population, billion

selected additional countries is described in the Country/ Economy Profiles in part 2 of this Report.

For the eighth consecutive year, Switzerland tops the GCI, achieving an even higher score than in previous years. Although its performance remains largely unchanged from last year, a small score improvement means Switzerland achieves the highest GCI score since the introduction of the current methodology in 2007. The country features in the top 10 of 11 GCI pillars and tops four of them: labor market efficiency, business sophistication, innovation, and technological readiness (for the first time). Switzerland arguably possesses one of the world's most fertile innovation ecosystems, combining a very conducive policy environment and infrastructure, academic excellence. an unmatched capacity to attract the best talent, and large multinationals that are often leaders in their sector as well as a dense network of small- and medium-sized enterprises across sectors that has a reputation for quality and a strive for innovation. Furthermore, intense collaboration between the academic and business worlds yields innovative products with commercial applications. Among the country's relative weaknesses are the persistent and deepening deflation (1.1 percent in 2015), the relative lack of market competition, hindrances to business creation, relatively high barriers to entry, and the low level of women's participation in the labor force in comparison with other advanced economies.

Singapore ranks 2nd for the sixth year in a row thanks to a remarkably strong performance. It features in the top 10 of ten pillars. It tops the higher education and training pillar and the goods market efficiency pillar, and ranks 2nd in a further five. Singapore's public institutions (2nd behind Finland) are transparent and highly efficient (1st on public-sector performance). Its infrastructures are among the world's best (2nd behind Hong Kong). Singapore boasts a stable macroeconomic environment

(11th) with healthy public finances (government budget has been in surplus since 2010). Singapore still lags behind the best-performing nations in the most sophisticated areas of competitiveness, with a relatively disappointing 19th rank in the business sophistication pillar and 9th rank in the innovation pillar.

The United States remains stable overall in 3rd position, showing improvement in areas including macroeconomic stability, the result of a declining budget deficit. Non-tariff barriers appear less burdensome than in the past. However, stagnating productivity has called for a downward revision of growth prospects, highlighting the need for a renewed competitiveness agenda even in the top-ranking economies. Despite being in the top 10 best-ranked economies and recent positive news showing recovering income growth across all income groups,23 the United States does not rank in the top 10 on any of the basic requirements pillars (institutions, infrastructure, macroeconomic environment, health and primary education). On the efficiency enhancers subindex, it is not within the top 10 on goods market efficiency or technological adoption. The position of the United States is driven by innovation, business sophistication, market size, financial market development, labor market efficiency, and higher education and training. These findings highlight important challenges if the country is to remain in the top 10 over the long term, and possible bottlenecks indicating the supply-side constraints that are holding back progress and reducing the effectiveness of monetary policy for jump-starting growth.

The **Netherlands** continues its climb toward the top of the Index, improving its score and rising by one spot to 4th. This is the result of small improvements across all three subindexes, with a solid and even performance across the pillars including top 10 ranks for infrastructure, health and primary education, higher education and training, goods market efficiency, technological readiness, business sophistication, and innovation. The Netherlands scores especially high on the quality of its scientific research institutions (4th) and closeness of links between universities and the private sector (5th). Success stories of social innovation are particularly frequent in the Netherlands.²⁴ One weakness is its 37th rank in financial market development, as both the perceived efficiency of and confidence and trust in the financial sector are low. On a continued upward trend, the country registers large positive moves again this year for labor market efficiency indicators, including for ease of hiring and firing; this comes in the wake of the entry into effect of the Work and Security Act in mid-2015.²⁵ Importantly, the Act attempts to improve the position of flexible workers and simplifies dismissal procedures.

Despite a slight improvement in its overall score, Germany drops one place to 5th. Its macroeconomic environment is generally stable, with a very low government deficit, yet-like the rest of the euro zoneit faces near-zero inflation. The country continues to push the innovation frontier, ranking high on the pillars of technological readiness (10th), innovation (5th), and business sophistication (3rd). Germany does well in efficiently using its talent (14th), supported by management practices that encourage worker involvement. As recent empirical evidence suggests, this type of decentralized management is effective in incentivizing quality upgrades and other types of product improvements,²⁶ which in turn boost export competitiveness.²⁷ An important labor market challenge for the coming year will be the integration of the large numbers of migrants, many of whom arrived over the course of 2015; first steps have been taken to lower labor market entry barriers for asylum seekers.²⁸ An improvement from 82nd to 65th is registered in an important business environment indicator, as the number of days to start a business is reduced from 14.5 to 10.5. Yet the data show a longer-term deterioration in another dimension of the business environment with a drop to 58th on the security indicators.

Sweden moves up three places to 6th with improvements in the basic factors of competitiveness, especially the macroeconomic environment. Growth has been robust, at 3.7 percent in 2016,29 and the country has managed to significantly decrease its deficit in 2015, jumping 30 places to 22nd on this indicator. The labor market functions reasonably well and Sweden has a high employment rate, with a high level of women's participation in the workforce. However, there is still room for improvement in labor market flexibility: Sweden has dropped 26 places to 120th in terms of the effect of taxation on incentives to work, and restrictive labor regulations are perceived as the second most problematic factor for doing business. The country also faces a difficult housing market: a continued increase in house prices could impede mobility and negatively impact labor market efficiency.30 Sweden is well equipped to embrace the Fourth Industrial Revolution, with a strong score on technological readiness and ranked within the top 10 in innovation. However, the availability of scientists and engineers is falling (down six places to 20th)—a reminder that renewed efforts to invest in human capital and skills are necessary to ensure long-term competitiveness and innovation capacity.

Currently the United Kingdom is still one of the most competitive economies in the world, moving up three places to 7th on the back of marginal score improvements. Note that the data were collected before the Brexit vote, so initial repercussions from the vote are not captured by this year's Index. Although the process and the conditions of Brexit are still unknown, it is likely to have a negative impact on the

United Kingdom's competitiveness through goods and financial markets as well as market size and, potentially, innovation. Competitiveness of the UK economy has, up to now, rested on highly efficient goods and labor markets (9th and 5th, respectively); business processes are highly sophisticated (7th) and supported by a high level of digital readiness by both businesses and consumers (3rd). Last year saw a partial recovery in the macroeconomic environment (up 23 to 85th) and an improvement in financial market conditions, although in general scores were mostly stable. For a detailed discussion of the potential impacts of Brexit, see Box 5.

Japan (8th) loses two places, overtaken by Sweden and the United Kingdom. The macroeconomic situation (104th) continues to undermine Japan's competitiveness performance, although the situation has improved over the past year (up 17 places) thanks to a lower, vet still very large, budget deficit. Inflation is now again very close to zero and the 2 percent target set by the Bank of Japan has been met only once since Shinzo Abe became Prime Minister. Japan is also beset by the rigidities and lack of dynamism of its labor market (19th). Despite progressing eight places, Japan still ranks a low 115th on the ease of hiring and firing. The ratio of women to men in the labor force (77th) is one of the lowest among high-income economies and Japan remains a rather unattractive destination for foreign talent (77th). The domestic market is relatively uncompetitive and closed, with high barriers to entry and to business creation. On the brighter side, Japan features in the top 10 of five pillars. It notably boasts an excellent infrastructure (5th) and firms are highly sophisticated (2nd), typically employing unique products and production processes (2nd) with significant control over international distribution (5th). High-quality research institutions (13th) and company spending on R&D (4th), coupled with an excellent availability of scientists and engineers (3rd), contribute to the country's overall highly innovative environment (5th). Yet Japan's innovation prowess seems to be eroding: consistently ranked in the top 5 between 2007 and 2015, Japan loses three positions and now ranks 8th.

Ranked for the fifth consecutive year in the top 10, Hong Kong SAR (9th, down two) achieves a strong and consistent performance: it ranks no lower than 33rd in any of the pillars and features in the top 10 of seven of them.31 It tops the infrastructure pillar for the seventh time, reflecting the outstanding quality of its facilities across all modes of transportation. Its financial sector (4th) is very well developed, highly sophisticated, trustworthy, and stable. Hong Kong's domestic market is highly competitive, efficient, and one of the most open in the world. Its labor market is among the world's most flexible and efficient (3rd worldwide). Finally, Hong Kong is hyper-connected and it boasts some of the highest rates of Internet use and mobile telephony penetration.

Its business community is also highly sophisticated (17th). The challenge for Hong Kong is to evolve from one of the world's foremost financial hubs to become an innovative powerhouse: with the exception of the market size pillar (33rd), innovation remains the weakest aspect (27th) of Hong Kong's performance and the business community consistently cites the capacity to innovate as their biggest concern.

Finland drops two places to 10th, mainly as a result of its weakening macroeconomic environment. The country has been hit hard by the global economic downturn-especially the fall of exports to Russia and the drop in demand for paper and electronic exports³² which has hurt Finland's competitiveness for the past three years. Although some improvements are perceived in the labor market (up three places to 23rd), with an improvement in the efficient use of talent (up one to 6th), these are offset by the market's rigidity (102nd): restrictive labor regulation is identified as the most problematic factor for doing business. The government's planned reforms in this area are to be commended.33 Finland can count on its first-class, efficient, and transparent institutions and its high-quality education system. Finland is also well positioned in terms of innovation, with its capacity to innovate supported by the excellent availability of scientists and engineers (1st) and a high degree of collaboration between universities and industry (2nd).

Canada drops slightly, by two places, to 15th. Since 2007, the most positive contributions to Canada's competitiveness score have come from improvements in technological readiness, health and primary education, and labor market efficiency. On the other hand, this year sees a continuing downward trend in innovation, business sophistication, financial market development, infrastructure, and goods market efficiency. Canada ranks among the top 10 countries in health and primary education, labor market efficiency, and financial market development. These strengths, together with monetary and fiscal policy, are helping the Canadian economy adjust to the fall in commodity prices, falling investment in the energy sector, and declining employment in energy-producing provinces. The negative income shock from the fall in terms of trade affected growth, but has been met by improvements in non-energy-exporting sectors. The shift of Canada to non-resource-led growth will benefit from the competitiveness strengths of the country but also requires work on the pillars that do not make it to the top 10.

The United Arab Emirates (UAE) improves by one place to 16th as it continues to lead the Middle East and North Africa region, building on improvements in competitiveness in recent years. This year small gains in areas such as technological adoption and business sophistication are partially offset by deteriorating macroeconomic stability that is the result of lower energy prices, which have led to a rise in inflation and public debt and to the emergence of a fiscal deficit. Overall, the UAE boasts a number of competitive strengths: infrastructure is top notch (4th overall) and goods and labor markets are open and efficient. Going forward, for the country to diversify its economy, enhancing innovation—where the country currently ranks 25th—will be crucial. There is equal scope for better leveraging digital technologies that are an important enabler of business innovation. Currently the country ranks 29th in ICT use.

France remains stable this year (moving up one spot to 21st). Its largest improvement is in the innovation and sophistication subindex (15th, up five), although the underlying score improvements are small. The macroeconomic environment (67th) is improving but still weak: although the budget deficit has been reduced, government debt is approaching 100 percent of GDP and inflation is near zero. Relatively low levels of efficiency of both the goods and labor markets have traditionally weighed down competitiveness in France. In a move that should ultimately boost competitiveness, the French government pushed through wide-ranging labor market reforms in July 2016 against considerable opposition. Going forward, France will need to ensure that its talent base does not erode: the GCI data suggest that France's capacity to attract and retain talent has deteriorated since last year (51st, down nine, and 86th, down 23, respectively); this includes the availability of scientist and engineers, although the talent pool is still relatively large in this case (26th overall).

Australia's (22nd) performance is stable compared with the previous edition and remarkably consistent yet never stellar-Australia does not rank lower than 28th across the 12 pillars, and it ranks in the top 10 of three pillars. Notable strengths include access to education and the quality of its education system. Australia places 10th in the health and primary education pillar and 9th in higher education and training. Improving further, Australia now ranks 6th overall in the financial development pillar, thanks to the high level of trust and confidence in the system. The efficiency of the labor market, where Australia used to rank in the 50s, improves further (28th, up eight)—a gain of almost 30 places over the past three years. Despite the prolonged commodity bust, Australia's performance in the macroeconomic situation (23rd, up five) is strong, with the government reducing the fiscal deficit to less than 3 percent. Innovation represents Australia's challenge and imperative in the face of low commodity prices and China's slowdown. In both business sophistication (28th, down one) and innovation (26th, down three), Australia not only lags far behind the best performers but also loses ground to them.

The Republic of Korea places 26th for the third consecutive year. This stable overall position conceals some notable improvement in a number of pillars.

Building on healthy public finances, the country improves two places to a remarkable 3rd rank (behind Norway and Qatar) in the macroeconomic environment pillar. Korea also makes strides in the institutions pillar (63rd, up six), owing to improved public-sector performance (77th, up seven), security situation (55th, up 19), and corporate accountability (60th, up 15). Korea also post gains in infrastructure, entering the top 10 of this pillar for the first time. In the labor market efficiency pillar, one of the areas where it has struggled the most historically, Korea is improving, but from a low base (77th, up six), suffering from rigidities (119th): it notably ranks 113th for the ease of firing and hiring workers, 112th for the average cost of redundancy, and 135th for the quality of social dialogue. After several years of decline, the country improves markedly in the financial development pillar (80th, up seven), posting gains in all indicators within the pillar except one. Although credit access conditions and low confidence in the banking system remain of concern, this encouraging development suggests that the financial reforms initiated by the government are starting to bear fruit. Finally, the quality of Korea's innovation remains excellent although it has eroded over the past year (20th, down one).

China retains its 28th rank for the third year in row. Its overall score improves, thanks to progress in some of the more sophisticated areas of competitiveness that contribute to shaping the country's innovation ecosystem. These include higher education (54th, up 14), innovation (30th, up one), and business sophistication (34th, up four). This bodes well for the future while China transitions to a new normal, where growth will need to be increasingly driven by innovation.34 Yet China still lags behind in technological readiness (74th. unchanged) despite a significant improvement in all components of this category since last year. A more widespread adoption of technology by business and the population at large will increase productivity and create a more fertile innovation ecosystem. The gains posted in these categories are partially offset by a worsening fiscal situation—the budget deficit more than doubled between 2014 and 2015, to reach 2.7 percent of GDPbut China still ranks a strong 8th in the macroeconomic pillar. In addition, little progress has been made over the past year in two areas that are critical for accelerating the transition to a new growth model. First, goods market efficiency (56th, up two) is undermined by various distortions, including the lack of competition caused by high barriers to entry for foreign firms (113th) and new businesses—it takes over a month to start up a business. Second, inefficiencies and instability characterize the financial sector (56th, down two)—the result of inefficiencies, non-performing loans, lack of competition, and suboptimal allocation of capital.35

Saudi Arabia comes in at 29th, losing four places mainly as a result of a deteriorating macroeconomic

environment following the drop in energy prices. The country has recently revealed its ambitious economic development program, which aims at widespread diversification of the economy in order to reduce dependence on oil by 2030. Achieving higher diversification will require building capacities in highend industries and services sectors. Strengthening education, particularly in terms of the quality of math and science training but also in management and primary education, will be necessary, but so will be a more flexible labor market that ensures that talent is used efficiently. Significant potential for improvement also exists with respect to financial markets, which remain less stable than in peer economies.

India climbs for the second year in a row, to 39th. Its 16-place improvement is the largest this year. India's competitiveness has improved across the board, in particular in goods market efficiency, business sophistication, and innovation. Thanks to improved monetary and fiscal policies, as well as lower oil prices, the Indian economy has stabilized and now boasts the highest growth among G20 countries. Recent reform efforts have concentrated on improving public institutions (up 16), opening the economy to foreign investors and international trade (up four), and increasing transparency in the financial system (up 15). Still, a lot needs to be done. The labor market is segmented between workers protected by rigid regulations and centralized wage determination (112th), especially in the manufacturing sector, and millions of unprotected and informal workers. The efficiency of the domestic market (81st) is hindered by fiscal regulations that allow federal states to levy different levels of value-added taxes; large, publicly owned enterprises further reduce the overall efficiency of the economy, especially in the utilities sector and the financial market, where there is growing concern about the incidence of non-performing loans. Finally, lack of infrastructure (68th) and ICT use (120th) remain bottlenecks. Improvement has been slow in recent years and further investment will be necessary, especially to connect rural areas and make sure they can equally benefit from and contribute to the country's development.

Indonesia (41st) drops four places as it is overtaken by a few countries. Despite many reforms to its business environment, its performance remains one of contrasts: the country ranks 10th for market size, 30th in the macroeconomic environment pillar-in spite of the protracted commodity bust-and 31st for innovation. It performs well in terms of financial development (42nd, up seven). But Indonesia ranks a low 100th in the health and basic education pillar (down 20),36 and 108th in the labor market efficiency pillar (up seven) as a result of various rigidities, prohibitive redundancy costs that amount to over a year's worth of salary (133rd), and the low labor force participation rate of women (115th). Indonesia

also ranks a low 91st in the technological readiness pillar (down six) because ICT penetration remains lowonly one fifth of the population uses the Internet and there is just one broadband connection for every 100 people. However, technology uptake by firms is more widespread (53rd).

The Russian Federation fell into recession in 2015, with its GDP shrinking by 3.7 percent, but nonetheless remained rather stable in terms of its competitiveness (up two places at 43rd). This is partly the result of strengthened fundamentals, including the quality and quantity of education (up six places) and innovation capacity (up 12, although from a low base), along with an improved domestic business environment, and less negative domestic business sentiment than expected. Low commodities prices are affecting the Russian Federation somewhat less than other Eurasian economies: the level of government debt remains relatively low and gross national savings are almost unchanged. According to the IMF, economic measures such as exchange rate flexibility, banking sector capital and liquidity injections, limited fiscal stimulus, and regulatory forbearance "cushioned the shocks, and helped restore confidence and stabilized the financial system."37 Nonetheless, the commodity price shock is still having a profound impact on the Russian economy: with sharply reduced public revenue and higher inflation, the Russian macroeconomic environment is much less sound, dropping to 91st place. The financial sector is suffering from a lower inflow of capital related to mineral revenues and the quasi-closure of international financial markets to Russian entities, as seen in the reduced availability of loans and venture capital.

Italy's competitiveness score has improved but more slowly than others', and it slips one spot to 44th. Its financial and labor markets and institutions continue to be its weakest areas, with rankings below 100th. Reforms implemented in recent years have improved businesses' perception of ethics and corruption (up 14), but publicsector performance remains poor, with pervasive red tape and a highly inefficient judicial system. Italy's labor market has become more efficient (up 17 since 2014): hiring and firing practices have been made more flexible and a framework was provided for more decentralized wage determination, but the full benefits of these reforms will require time and more cooperative laboremployer relations. In the meantime, Italy continues to squander its talent: in the south of the country, only one in three women work (according to the Italian Institute of Statistics (ISTAT), women's employment rate in southern Italy was 30.6 percent in 2015), while reforms to the pension system introduced in 2012, albeit necessary, have further closed the job market to youth. Financial market development (122nd) is Italy's weakest link: the banking sector is burdened by non-performing loans, and some institutions need recapitalization. Recent scandals

in mutual banks have further undermined trust, while governance issues-including the strong link with local banking foundations—have been only partially addressed. Italy has strengthened its macroeconomic position, but public debt remains high in light of low inflation. Innovation and business sophistication remain among the strengths of the Italian economy and Italy continues to improve important dimensions of its digital readiness as seen in the World Economic Forum's Global Information Technology Report 2016.

South Africa slightly improves both its score and ranking (47th, up two). It has been relatively less affected by commodity price falls than other economies in the region, and has registered marginal improvements in almost all aspects of competitiveness. Most significant areas of progress include enhanced competition, both locally (up 13 places) and internationally (up 16 places); better use of talent in terms of how pay reflects productivity (98th, up 29 places); and a small but important upgrade in the quality of education (up five places), with primary school enrollment also now passing 97 percent. However, a number of shortcomings may limit South African competitiveness going forward. Infrastructure development has stalled, both in transport and electricity, with power shortages experienced this year. Institutional quality has diminished, with increased political uncertainty, less transparency, some security concerns, and business leaders having less trust in politicians (down 11 places since last year). The slowdown of the Chinese economy and exchange rate volatility may dampen growth, now forecast at 0.1 percent for 2016. This makes it unlikely that the high unemployment rate will diminish soon, hampering the ability to leverage Africa's demographic dividend.

Mexico improves six positions to 51st place, mainly driven by gains in market efficiency. Domestic and foreign competition in the goods market all improve significantly, reflecting the results of competition and trade policy reforms. Labor markets have boosted flexibility and incentives, and financial markets have improved affordability. Primary education continues to be a significant competitiveness weakness compared to regional and global leaders, and institutional quality is lagging. The Mexican economy has been hit by falling oil prices, weak global trade, and a resulting fall in industrial production. However, it is still one of the most competitive economies in the region, and is making progress on some of the fundamental drivers of future prosperity.

Turkey drops four places to 55th (note that the data were collected before the attempted coup in July 2016). Nevertheless, considering the unstable geopolitical situation in neighboring countries and the pressures from migration—Turkey accounts for 56 percent of all registered Syrian refugees³⁸—the country has proven economically resilient. Its relative strengths include infrastructure, despite a lower score this year, and its macroeconomic environment (up 14 places to 54th)—in the face of persistently high inflation, the fall in oil prices has helped the country reduce its government budget deficit and debt. Turkey has made gains in higher education and training (up five places to 50th), increasing enrollment rates in secondary and tertiary education. However, building a highly skilled workforce will require improving the quality of education and investing in on-the-job training. Weaknesses in the labor market (126th) need to be urgently addressed through structural reforms to increase flexibility and use talent more efficiently. To create a more dynamic business environment, domestic competition needs to be improved (Turkey drops 11 places to 53rd), and investments are needed to develop a sound innovation ecosystem to help the country move up the global value chain. This includes improving business sophistication and fostering companies' innovation by boosting workforce qualifications—the quality of scientific research institutions drops this year to 103rd. Reforms are also needed to make public institutions more efficient and transparent.

Jordan retains its position at 63rd place despite the daunting challenges it has to face as a result of the geopolitical situation in the region. Jordan has the advantage of having a fairly efficient goods market (43rd) because of a certain intensity of domestic competition that raises the efficiency of firms. The country also has relatively efficient financial markets (33rd), although trustworthiness and confidence in the financial sector needs to be strengthened (107th) and the labor market has some flexibility (29th). Going forward, Jordan can take advantage of its fairly vibrant business sector (36th) and healthy level of adoption of technologies from abroad (40th) to achieve a higher, more sustainable growth path. Addressing macroeconomic challenges will be key to freeing up public funding for competitivenessenhancing investment, in particular in education (91st on primary education and 64th on enrollment in secondary and tertiary levels).

In the context of negative terms of trade shocks and political turmoil, Brazil falls six positions to 81st. This is driven mainly by deteriorating goods, labor, and financial markets. On the institutional side, security has deteriorated and also the perception of the quality of public-sector administration. However, Brazil has improved in areas such as protection of property rights and measures of undue influence, and the country's bounce back after a sharp drop last year probably reflects the fight against corruption and for judicial independence. The political uncertainty and the government's sinking finances are still impediments to consolidating a pro-growth competitiveness agenda in the largest economy in Latin America and the Caribbean. Brazil is currently going through a recession. The country's growth rate has decelerated steadily, from an average annual growth rate of 4.5 percent between 2006 and 2010 to 2.1 percent between 2011 and 2014, according to the World Bank, and negative growth is projected for 2015 and 2016. Addressing the macroeconomic imbalances facing the country, including large current account and government deficits and increasing inflation, requires improving productivity, starting with the macroeconomic environment and addressing the market distortions affecting how markets work.

Cambodia ranks 89th, up one position from last year. Among Asian nations, it is the one that has posted the largest GCI score improvement-from 3.5 to 4.0since 2007. Despite the positive trend, the challenges are many and significant. Cambodia ranks no better than 50th in any of the 12 pillars of the Index; in half of them it sits beyond the 100th mark. Of particular concern is its mediocre performance in three of the four areas that constitute the basic drivers of competitiveness: institutions (104th, up seven), infrastructure (106th, down five), and health and primary education (103rd, down 16). Moreover, Cambodia ranks 124th in higher education and training, its poorest performance in any pillar. It is estimated that secondary education enrollment is around 50 percent. With a median age of 23.8, Cambodia is home to one of the youngest populations in Asia.³⁹ Ensuring access to quality of education for all should therefore be a policy priority.

Argentina gains two positions to 104th, driven mainly by innovation and sophistication factors, reflecting better preparedness to cope with a changing future environment. The quality of institutions improved mainly through better intellectual property protection and a more efficient legal framework. The quality of education and use of talent show signs of progress, as does the efficiency of goods markets. Argentina's improvement in both ranking and score comes while a new administration implements broad reforms in an adverse external context: the recession in Brazil, Argentina's main trading partner; low commodity prices; adjustments in utility tariffs; and high inflation have all made the transition toward a more market-oriented model difficult. Consumer sentiment remains weak but growth is expected to rebound, supported by competitivenessimproving reforms.

CONCLUSIONS

Nearly 10 years after the global financial crisis, the world has not yet fully recovered from the Great Recession that followed. Productivity is falling or stagnant, employment is below peak pre-crisis levels, and growth remains sluggish. Slower growth is magnifying tensions within high-income countries as large segments of the traditionally well-off middle class see their income gains lag behind those of top earners; a growing middle class

in emerging countries is demanding better government and public goods. Governments in many of these countries, however, are facing tighter constraints as a result of lower revenues from commodity sectors, and still struggle with the burden of corruption and unfinished work on basic fundamentals of competitiveness such as pro-growth institutions and infrastructure. At the same time, the dawn of the Fourth Industrial Revolution, with rapid leveraging of digital technologies transforming businesses and entire production systems, represents a source of opportunity.

Against this backdrop, global competitiveness remains hampered by long-term challenges. Large gaps remain within regions and globally, reflecting the need to work on renewed competitiveness agendas and sources of global inequality. Slow progress among commodity-dependent countries to boost resilience through diversification, and widespread failure to build an enabling environment that allows innovation to truly flourish, create negative feedback loops between low competitiveness, macroeconomic vulnerability, and low diversification.

This year, the Report stresses the renewed importance of addressing supply-side constraints to growth. Income levels have recovered faster in countries with better competitive conditions even as those countries have resorted less to quantitative easing, creating less stress on their central banks.

The second key finding is that more open economies are also more innovative. Therefore, falling openness—in the form of increased non-tariff barriers to trade and investment—represents a real threat to future prosperity.

Although innovation and technology are gaining importance as drivers of competitiveness for all countries, advanced and emerging, the results this year show that all factors of competitiveness are complementary and should be addressed simultaneously. Making sustainable, long-term overall progress requires addressing gaps in all pillars, laying the foundations for more vibrant economies with new productive sectors.

The Global Competitiveness Report seeks to help policymakers and the private sector identify areas for fruitful long-term public-private collaboration for growth. The ability to track progress, identify success stories, and prioritize growth agendas is essential for galvanizing multiple stakeholders around structured public-private dialogue that overcomes the constraints of the political cycle and the short-term and special interests of all parties. As the world embraces the Fourth Industrial Revolution, Chapter 1.2 presents progress on a modernized Global Competitiveness Index that will continue to serve as the foremost benchmarking tool for pro-competitive agenda building.

- 6 When interpreting the data, it is important to keep in mind that we consider economies with small changes in ranking of one or two places as stable because this small ranking change often reflects only small changes in score. This is the case in particular in the middle of the rankings, where economies' scores are relatively close together and small changes in score can translate to relatively large changes in rank. Another key consideration is that the ranking is relative, so both score and rank need to be considered together when interpreting the results.

Appendix A: Methodology and Computation of the Global Competitiveness Index 2016-2017

This appendix presents a short description of each pillar of the Global Competitiveness Index 2016-2017 (GCI) and of the application of the concept of stages of development to weight the Index. For a more detailed description and literature review for each pillar, refer to Chapter 1.1 in The Global Competitiveness Report 2014-2015.^a The appendix also presents the detailed structure of the GCI and explains how the Index is computed.

THE TWELVE PILLARS OF COMPETITIVENESS

We define competitiveness as the set of institutions, policies, and factors that determine the level of productivity of a country. The level of productivity, in turn, sets the level of prosperity that can be reached by an economy. The productivity level also determines the rates of return obtained by investments in an economy, which in turn are the fundamental drivers of its growth rates. In other words, a more competitive economy is one that is likely to grow faster over time.

This open-endedness is captured within the GCI by including a weighted average of many different components, each measuring a different aspect of competitiveness. The components are grouped into 12 categories, the pillars of competitiveness:

1st pillar: Institutions

The institutional environment of a country depends on the efficiency and the behavior of both public and private stakeholders. The legal and administrative framework within which individuals, firms, and governments interact determines the quality of the public institutions of a country and has a strong bearing on competitiveness and growth. It influences investment decisions and the organization of production and plays a key role in the ways in which societies distribute the benefits and bear the costs of development strategies and policies. Good private institutions are also important for the sound and sustainable development of an economy. The 2007-08 global financial crisis, along with numerous corporate scandals, has highlighted the relevance of accounting and reporting standards and transparency for preventing fraud and mismanagement, ensuring good governance, and maintaining investor and consumer confidence.

2nd pillar: Infrastructure

Extensive and efficient infrastructure is critical for ensuring the effective functioning of the economy. Effective modes of transport—including high-quality roads, railroads, ports, and air transport-enable entrepreneurs to get their goods and services to market in a secure and timely manner and facilitate the movement of workers to the most suitable jobs. Economies also depend on electricity supplies that are free from interruptions and shortages so that businesses and factories can work unimpeded. Finally, a solid and extensive telecommunications network allows for a rapid and free flow of information, which increases overall economic efficiency by helping to ensure that businesses can communicate and decisions are made by economic actors taking into account all available relevant information.

3rd pillar: Macroeconomic environment

The stability of the macroeconomic environment is important for business and, therefore, is significant for the overall competitiveness of a country. Although it is certainly true that macroeconomic stability alone cannot increase the productivity of a nation, it is also recognized that macroeconomic disarray harms the economy, as we have seen in recent years, conspicuously in the European context. The government cannot provide services efficiently if it has to make high-interest payments on its past debts. Running fiscal deficits limits the government's future ability to react to business cycles. Firms cannot operate efficiently when inflation rates are out of hand. In sum, the economy cannot grow in a sustainable manner unless the macro environment is stable.

4th pillar: Health and primary education

A healthy workforce is vital to a country's competitiveness and productivity. Workers who are ill cannot function to their potential and will be less productive. Poor health leads to significant costs to business, as sick workers are often absent or operate at lower levels of efficiency. Investment in the provision of health services is thus critical for clear economic, as well as moral, considerations. In addition to health, this pillar takes into account the quantity and quality of the basic education

received by the population, which is increasingly important in today's economy. Basic education increases the efficiency of each individual worker.

5th pillar: Higher education and training

Quality higher education and training is crucial for economies that want to move up the value chain beyond simple production processes and products. In particular, today's globalizing economy requires countries to nurture pools of well-educated workers who are able to perform complex tasks and adapt rapidly to their changing environment and the evolving needs of the production system. This pillar measures secondary and tertiary enrollment rates as well as the quality of education as evaluated by business leaders. The extent of staff training is also taken into consideration because of the importance of vocational and continuous on-the-job training—which is neglected in many economies—for ensuring a constant upgrading of workers' skills.

6th pillar: Goods market efficiency

Countries with efficient goods markets are well positioned to produce the right mix of products and services given their particular supply-and-demand conditions, as well as to ensure that these goods can be most effectively traded in the economy. Healthy market competition, both domestic and foreign, is important in driving market efficiency, and thus business productivity, by ensuring that the most efficient firms, producing goods demanded by the market, are those that thrive. Market efficiency also depends on demand conditions such as customer orientation and buyer sophistication. For cultural or historical reasons, customers may be more demanding in some countries than in others. This can create an important competitive advantage, as it forces companies to be more innovative and customeroriented and thus imposes the discipline necessary for efficiency to be achieved in the market.

7th pillar: Labor market efficiency

The efficiency and flexibility of the labor market are critical for ensuring that workers are allocated to their most effective use in the economy and provided with incentives to give their best effort in their jobs. Labor markets must therefore have the flexibility to shift workers from one economic activity to another rapidly and at low cost, and to allow for wage fluctuations without much social disruption. Efficient labor markets must also ensure clear strong incentives for employees and promote meritocracy at the workplace, and they must provide equity in the business environment between women and men. Taken together these factors have a positive effect on worker performance and the attractiveness of the country for talent, two aspects of the labor market that are growing more important as talent shortages loom on the horizon.

8th pillar: Financial market development

An efficient financial sector allocates the resources saved by a nation's population, as well as those entering the economy from abroad, to the entrepreneurial or investment projects with the highest expected rates of return rather than to the politically connected. Business investment is critical to productivity. Therefore economies require sophisticated financial markets that can make capital available for private-sector investment from such sources as loans from a sound banking sector, well-regulated securities exchanges, venture capital, and other financial products. In order to fulfill all those functions, the banking sector needs to be trustworthy and transparent, and—as has been made so clear recently—financial markets need appropriate regulation to protect investors and other actors in the economy at large.

9th pillar: Technological readiness

The technological readiness pillar measures the agility with which an economy adopts existing technologies to enhance the productivity of its industries, with specific emphasis on its capacity to fully leverage information and communication technologies (ICTs) in daily activities and production processes for increased efficiency and enabling innovation for competitiveness. Whether the technology used has or has not been developed within national borders is irrelevant for its ability to enhance productivity. The central point is that the firms operating in the country need to have access to advanced products and blueprints and the ability to absorb and use them. Among the main sources of foreign technology, FDI often plays a key role, especially for countries at a less advanced stage of technological development.

10th pillar: Market size

The size of the market affects productivity since large markets allow firms to exploit economies of scale. Traditionally, the markets available to firms have been constrained by national borders. In the era of globalization, international markets have become a substitute for domestic markets, especially for small countries. Thus exports can be thought of as a substitute for domestic demand in determining the size of the market for the firms of a country. By including both domestic and foreign markets in our measure of market size, we give credit to export-driven economies and geographic areas (such as the European Union) that are divided into many countries but have a single common market.

11th pillar: Business sophistication

Business sophistication concerns two elements that are intricately linked: the quality of a country's overall business networks and the quality of individual firms' operations and strategies. These factors are especially important for countries at an advanced stage of

development when, to a large extent, the more basic sources of productivity improvements have been exhausted. The quality of a country's business networks and supporting industries, as measured by the quantity and quality of local suppliers and the extent of their interaction, is important for a variety of reasons. When companies and suppliers from a particular sector are interconnected in geographically proximate groups, called clusters, efficiency is heightened, greater opportunities for innovation in processes and products are created, and barriers to entry for new firms are reduced.

12th pillar: Innovation

The last pillar focuses on innovation. Innovation is particularly important for economies as they approach the frontiers of knowledge, and the possibility of generating more value by merely integrating and adapting exogenous technologies tends to disappear. In these economies, firms must design and develop cutting-edge products and processes to maintain a competitive edge and move toward even higher value-added activities. This progression requires an environment that is conducive to innovative activity and supported by both the public and the private sectors. In particular, it means sufficient investment in research and development (R&D), especially by the private sector; the presence of high-quality scientific research institutions that can generate the basic knowledge needed to build the new technologies; extensive collaboration in research and technological developments between universities and industry; and the protection of intellectual property.

The interrelation of the 12 pillars

Although we report the results of the 12 pillars of competitiveness separately, it is important to keep in mind that they are not independent: they tend to reinforce each other, and a weakness in one area often has a negative impact in others. The detailed structure and methodology used to compute the GCI are presented at the end of this appendix.

STAGES OF DEVELOPMENT AND THE WEIGHTED **INDEX**

Although all of the pillars described above will matter to a certain extent for all economies, it is clear that they affect different economies in different ways.

In line with well-known economic theory of stages of development, the GCI assumes that, in the first stage, the economy is factor-driven and countries compete based on their factor endowments—primarily unskilled labor and natural resources.b Maintaining competitiveness at this stage of development hinges primarily on well-functioning public and private institutions (1st pillar), a well-developed infrastructure (2nd pillar), a stable macroeconomic environment (3rd

pillar), and a healthy workforce that has received at least a basic education (4th pillar).

As a country becomes more competitive, productivity will increase and wages will rise with advancing development. Countries will then move into the efficiency-driven stage of development, when they must begin to develop more-efficient production processes and increase product quality because wages have risen and they cannot increase prices. At this point, competitiveness is increasingly driven by higher education and training (5th pillar), efficient goods markets (6th pillar), well-functioning labor markets (7th pillar), developed financial markets (8th pillar), the ability to harness the benefits of existing technologies (9th pillar), and a large domestic or foreign market (10th pillar).

Finally, as countries move into the *innovation-driven* stage, wages will have risen by so much that they are able to sustain those higher wages and the associated standard of living only if their businesses are able to compete using the most sophisticated production processes (11th pillar) and by innovating new ones (12th pillar).

The GCI takes the stages of development into account by attributing higher relative weights to those pillars that are more relevant for an economy given its particular stage of development. To implement this concept, the pillars are organized into three subindexes, each critical to a particular stage of development.

The basic requirements subindex groups those pillars most critical for countries in the factor-driven stage. The efficiency enhancers subindex includes those pillars critical for countries in the efficiency-driven stage. And the innovation and sophistication factors subindex includes the pillars critical to countries in the innovationdriven stage.

The weights attributed to each subindex in every stage of development are shown in Table 1.

Two criteria are used to allocate countries into stages of development. The first is the level of GDP per capita at market exchange rates. The thresholds used are also reported in Table 1. A second criterion is used to adjust for countries that, based on income, would have moved beyond stage 1, but where prosperity is based on the extraction of resources. This is measured by the share of exports of mineral goods in total exports (goods and services), and assumes that countries with more than 70 percent of their exports made up of mineral products (measured using a five-year average) are to a large extent factor driven.c Countries that are resource driven and significantly wealthier than economies at the technological frontier are classified in the innovationdriven stage.d Any countries falling between two of the three stages are considered to be "in transition." For these countries, the weights change smoothly as a country develops, reflecting the smooth transition from one stage of development to another. The classification

Table 1: Subindex weights and income thresholds for stages of development

		ST	AGE OF DEVELOPMENT		
	Stage 1: Factor-driven	Transition from stage 1 to stage 2	Stage 2: Efficiency-driven	Transition from stage 2 to stage 3	Stage 3: Innovation-driven
GDP per capita (US\$) thresholds*	<2,000	2,000-2,999	3,000-8,999	9,000-17,000	>17,000
Weight for basic requirements	60%	40-60%	40%	20-40%	20%
Weight for efficiency enhancers	35%	35-50%	50%	50%	50%
Weight for innovation and sophistication factors	5%	5-10%	10%	10-30%	30%

^{*} For economies with a high dependency on mineral resources, GDP per capita is not the sole criterion for the determination of the stage of development. See text for details.

Table 2: Classification by each stage of development

Stage 1: Factor-driven	Transition from	Stage 2:	Transition from	Stage 3: Innovation-driven
(35 economies)	stage 1 to stage 2 (17 economies)	Efficiency-driven (30 economies)	stage 2 to stage 3 (19 economies)	(37 economies)

DACIC DECLIDEMENTS

Weight (%) within immediate parent category

20 C00/f

of countries into stages of development is shown in Table 2.

STRUCTURE AND COMPUTATION OF THE INDEX

The computation of the GCI is based on successive aggregations of scores from the indicator level (i.e., the most disaggregated level) all the way up to the overall GCI score. Unless noted otherwise, we use an arithmetic mean to aggregate individual indicators within a category.e For the higher aggregation levels, we use the percentage shown next to each category. This percentage represents the category's weight within its immediate parent category. Reported percentages are rounded to the nearest integer, but exact figures are used in the calculation of the GCI. For example, the score a country achieves in the 11th pillar accounts for 50 percent of this country's score in the innovation and sophistication factors subindex, irrespective of the country's stage of development. Similarly, the score achieved on the subpillar transport infrastructure accounts for 50 percent of the score of the infrastructure pillar.

Unlike the case for the lower levels of aggregation, the weight put on each of the three subindexes (basic requirements, efficiency enhancers, and innovation and sophistication factors) is not fixed. Instead, it depends on each country's stage of development, as discussed in the chapter.f For instance, in the case of Burundi-a country in the first stage of development—the score in the basic requirements subindex accounts for 60 percent of its overall GCI score, while it represents just 20 percent of the overall GCI score of Sweden, a country in the third stage of development. For countries in transition between stages, the weighting applied to each subindex is reported in the corresponding profile at the end of this volume. For instance, in the case of Turkey, currently in transition from stage 2 to stage 3, the weight on each subindex is 38.9 percent, 50 percent, and 11.1 percent, respectively, as reported in the country profile on page 346.

Indicators that are not derived from the Executive Opinion Survey (the Survey) are identified by an asterisk (*) in the following list. The Technical Notes and Sources section at the end of the Report provides detailed information about each of these indicators. To make the aggregation possible, the indicators are converted to a 1-to-7 scale in order to align them with the Survey results. We apply a min-max transformation, which preserves the order of, and the relative distance between, country scores.9

Indicators that are followed by the designation "1/2" enter the GCI in two different pillars. In order to avoid double counting, we assign a half-weight to each instance.h

NOTES

- a World Economic Forum 2014.
- See Chapter 1.1 of The Global Competitiveness Report 2007–2008 for a complete description of how we have adapted Michael Porter's theory for the present application.
- c In order to capture the resource intensity of the economy, we use as a proxy the exports of mineral products as a share of overall exports according to the sector classification developed by the International Trade Centre in their Trade Performance Index. In addition to crude oil and gas, this category also contains all metal ores and other minerals as well as petroleum products, liquefied gas, coal, and precious stones. The data used cover the years 2011 through 2015. Further information on these data can be found at http://www.intracen.org/itc/market-info-tools/tradestatistics/

All countries with more than 70 percent of their exports made up of mineral products are considered to be to some extent factor driven. The stage of development for these countries is adjusted downward smoothly depending on the exact primary export share. The higher the minerals export share, the stronger the adjustment and the closer the country will move to stage 1. For example, a country that exports 95 percent of mineral exports and that, based on the income criteria, would be in stage 3 will be in transition between stages 1 and 2. The income and primary exports criteria are weighted identically. Stages of development are dictated solely by income for countries that export less than 70 percent minerals. Countries that export only primary products would automatically fall into the factor-driven stage (stage 1).

- d In practice, this applies to countries where the GDP per capita at current market prices has, for the past five years, been above an average of that of economies at the technology frontier. Countries at the technology frontier are the 10 countries with the highest number of Patent Cooperation Treaty patent applications per
- e Formally, for a category *i* composed of *K* indicators, we have:

$$category_{i} = \frac{\sum\limits_{k=1}^{K} indicator_{k}}{K}$$

- f As described above, the weights are as specified in Table 1 of this appendix. Refer to individual country/economy profiles at the end of this Report for the exact weights used in the computation of each economy's GCI score.
- g Formally, we have:

6 x
$$\left(\frac{\text{country score - sample minimum}}{\text{sample maximum - sample minimum}}\right)$$
 + 1

The sample minimum and sample maximum are, respectively, the lowest and highest country scores in the sample of economies covered by the GCI. In some instances, adjustments were made to account for extreme outliers. For those indicators for which a higher value indicates a worse outcome (e.g., disease incidence, government debt), the transformation formula takes the following form, thus ensuring that 1 and 7 still correspond to the worst and best possible outcomes, respectively:

$$-6 \ \ \text{x} \ \ \left(\frac{\text{country score - sample minimum}}{\text{sample maximum - sample minimum}}\right) + \ 7$$

h For those categories that contain one or several half-weight indicators, country scores are computed as follows:

(sum of scores on full-weight variables) + $\frac{1}{2}$ × (sum of scores on half-weight variables) (count of full-weight variables) + $\frac{1}{2}$ × (count of half-weight variables)

i "N/Appl." is used for economies where there is no regular train service or where the network covers only a negligible portion of the territory. Assessment of the existence of a network was conducted by the World Economic Forum based on various sources.

- j In order to capture the idea that both high inflation and deflation are detrimental, inflation enters the model in a U-shaped manner as follows: for values of inflation between 0.5 and 2.9 percent. a country receives the highest possible score of 7. Outside this range, scores decrease linearly as they move away from these values.
- k The impact of malaria, tuberculosis, and HIV/AIDS on competitiveness depends not only on their respective incidence rates but also on how costly they are for business. Therefore, in order to estimate the impact of each of the three diseases, we combine its incidence rate with the Survey question on its perceived cost to businesses. To combine these data we first take the ratio of each country's disease incidence rate relative to the highest incidence rate in the whole sample. The inverse of this ratio is then multiplied by each country's score on the related Survey question. This product is then normalized to a 1-to-7 scale. Note that countries with zero reported incidence receive a 7, regardless of their scores on the related Survey question. In the case of malaria, countries receive a 7 if the World Health Organization (WHO) has classified them as malaria-free countries or included them in the supplementary list of areas where malaria has never existed or has disappeared without specific measures.
- I The competition subpillar is the weighted average of two components: domestic competition and foreign competition. In both components, the included indicators provide an indication of the extent to which competition is distorted. The relative importance of these distortions depends on the relative size of domestic versus foreign competition. This interaction between the domestic market and the foreign market is captured by the way we determine the weights of the two components. Domestic competition is the sum of consumption (C), investment (I), government spending (G), and exports (X), while foreign competition is equal to imports (M). Thus we assign a weight of (C + I + G + X)/(C + I + G + X + M) to domestic competition and a weight of M/(C + I + G + X + M) to foreign competition.
- m Indicators 6.06 and 6.07 combine to form one single indicator.
- n For indicator 6.14, imports as a percentage of GDP, we first apply a log-transformation and then a min-max transformation.
- o The size of the domestic market is constructed by taking the natural log of the sum of the gross domestic product valued at purchased power parity (PPP) (indicator 10.03) plus the total value (PPP estimates) of imports of goods and services (indicator 6.14), minus the total value (PPP estimates) of exports of goods and services (indicator 10.04). Data are then normalized on a 1-to-7 scale. PPP estimates of imports and exports are obtained by taking the product of exports as a percentage of GDP and GDP valued at PPP.
- p The size of the foreign market is estimated as the natural log of the total value (PPP estimates) of exports of goods and services, normalized on a 1-to-7 scale. PPP estimates of exports are obtained by taking the product of exports as a percentage of GDP (indicator 10.04) and GDP valued at PPP (10.03).

Appendix B: Global Competitiveness Index 2016–2017 rankings

The following pages report the GCI 2016-2017 rankings for the three subindexes (Table 1) and their corresponding pillars (Tables 2-4). Detailed scorecards for all the economies are available at the end of the Report. Enhanced scorecards and sortable rankings for every component of the GCI are available at http://gcr.weforum.org/.

CHAPTER 1.2

Modernizing the Measurement of **Drivers of Prosperity** in Light of the Fourth **Industrial Revolution:** The Updated Global Competitiveness Index

XAVIER SALA-I-MARTÍN

Columbia University

ROBERTO CROTTI SILJA BALLER ATTILIO DI BATTISTA MARGARETA DRZENIEK-HANOUZ THIFRRY GFIGER DANIEL GÓMEZ GAVIRIA **GAËLLE MARTI** World Economic Forum

Economies and people worldwide are starting to feel the first effects of the dawning Fourth Industrial Revolution, a convergence of technologies that is blurring the lines between the physical, digital, and biological in ways that promise to disrupt almost every industry in every country.1

Breakthroughs are happening and proliferating at an unprecedented pace—from sensors to blockchain to human-brain interfaces. Technology-enabled platforms in the "sharing" or "on-demand" economies are upending business models and forcing countries to rethink how they formulate economic policies. The number of industrial robots in the world is roughly doubling every five years (from 69,000 in 2002 to 229,000 in 2014, as shown in Figure 1, and is projected to reach 400,000 by 2018),2 driven especially by demand from automotive parts suppliers and the electrical/electronics industry. As the Internet of Things becomes mainstream, the number of connected devices will almost triple by 2020, from 13.4 billion to 38.5 billion,3 and the proportion of products sold via e-commerce will more than double, from 6 percent in 2014 to 12.8 percent by 2019.4

The combination of automation and digitalization is revolutionizing manufacturing and services alike, as well as blurring the lines between them. This process is increasing efficiency, optimizing logistics, and making prices more transparent and competition starker. At the same time, it is reinforcing the need of firms to remain ahead of the innovation curve. More and more, technological forces are pushing companies to either innovate or disappear: 88 percent of firms in the 1955 Fortune 500 were not on the 2014 list, and the rate of turnover is accelerating, while the duration of product lifecycles declined, across all industries, by 24 percent between 1997 and 2012.5

Such dramatic changes in the dynamics of the economy need to be reflected in how we measure economic progress and its drivers. These changes make it necessary to better understand how the Fourth Industrial Revolution is altering how we understand competitiveness, growth, and-fundamentally-the prosperity of countries (see Box 1 for further discussion). For purposes of the present report, an important question is how it impacts the drivers of competitiveness captured by the Global Competitiveness Index.

The increased complexity of today's economy is arguably making our current statistical tools outdated, both conceptually and methodologically. Calculation methods built for tracking physical sales of goods and services are incapable of accurately measuring transactions that take place on virtual platforms or

The authors invite feedback on this chapter. Please send feedback and comments to gcp@weforum.org.

Figure 1: Estimated worldwide annual supply of industrial

Sales of industrial robots (1,000 units)

through non-monetary exchanges of services. Increased measurement challenges in calculating GDP have lessened its value as an indicator of economic progress (see Box 2), and also calls into question the accuracy of productivity estimates, which require precise evaluation of output, capital, and labor.

Measuring the drivers of prosperity likewise requires a conceptual and methodological rethink. When the Global Competitiveness Index (GCI) was introduced in 2006, the effects of the Fourth Industrial Revolution had not yet started to arise. Today, although the main drivers of competitiveness identified at that time remain generally valid, they may affect the development process in a different way than they did a decade ago.

Box 1: The competitiveness factors supporting the Fourth Industrial Revolution

The possibilities of the Fourth Industrial Revolution to produce productivity gains and, therefore, greater prosperity for both individuals and communities depend on a number of factors. Ultimately the goal is for individuals, firms, and sectors to be able to access emerging technologies, incorporate them into their innovation and operational processes, and participate meaningfully in both new and transforming value networks.

It is tempting to assume that the competitiveness factors that matter the most for firms and countries looking to benefit from the Fourth Industrial Revolution are linked primarily to measures of technological sophistication and innovation. Indeed, this edition of The Global Competitiveness Report shows that levels of business sophistication and the strength of innovation-related factors are becoming more influential in driving competitiveness, and many of the characteristics of technologies that are driving the Fourth Industrial Revolution (such as their networked nature) suggest that these factors will continue to rise in importance. However, many other factors also influence the ability of an economy to employ and develop emerging technologies. As this chapter outlines, the Forum's approach to measuring innovation is itself changing, taking an integrated, future-oriented, and ecosystemic approach to the link between productivity and new products and processes, moving away from a linear process of idea creation to commercialization.

A hallmark of the Fourth Industrial Revolution is the way in which it converges with, relies on, and employs digital technologies and business models in order to create, exchange, and distribute value, requiring digital infrastructure and network availability in addition to business sophistication. The innovation ecosystem pillars in the revised Global Competitiveness Index presented in this chapter offer an approach that captures all of these ideas: the Fourth Industrial Revolution does not rely only on ICT technologies but also on non-ICT technologies, as reflected in the revamped technology adoption pillar; the possibility of recouping investments through economies of scale as reflected in the new market size pillar; the business dynamism pillar showing the factors that drive entrepreneurial spirit and ways businesses respond to opportunity; and, finally, the pillar showing innovation capacity going beyond R&D to incorporate the factors that incentivize creativity, ideageneration, and collaboration.

A companion report, the Forum's Global Information Technology Report 2016, explores some of these aspects: the ways in which network readiness is essential to enabling the creation and use of emerging technologies. The 2016 report reveals that countries looking to capitalize on economic gains of ICTs should promote not just access, but also adoption and use of digital networks.

Adoption—the successful use and development of emerging technologies—of course requires human capital, which is another critical input of the Fourth Industrial Revolution in the form of healthy, educated populations. The new human capital pillars of the GCI, divided into a heath pillar and an education and skills pillar captures these two forms of investment in human capital. In particular, the education and skills pillar looks at both the skills of the current work force and the skills of the future work force. In line with finding from the Forum's Future of Jobs report, this pillar includes indicators on critical thinking in teaching.

Finally, while the Fourth Industrial Revolution will feature technologies such as the blockchain that can support both private and public governance, these technologies alone will not replace the importance of an enabling environment. The framework presented in this chapter covers three pillars that will be essential for economies looking to capitalize on the Fourth Industrial Revolution: institutions, such as rule of law and smooth functioning of public administration; infrastructure reflecting investment in new measures of connectivity; and a healthy macroeconomic context.

Contributed by Nicholas Davis, Head of Society and Innovation, Member of the Executive Committee, World Economic Forum

This chapter lays out the Forum's latest thinking on the concept of competitiveness and its implications for the GCI in light of the new forces that are starting to be unleashed by the Fourth Industrial Revolution and other trends. The goal of the chapter is to provide a basis for discussion and feedback ahead of the launch of the new methodology.

THE GCI IN THE TIME OF THE FOURTH INDUSTRIAL REVOLUTION

The need to produce measurements that better capture this emerging new economic reality translates into an evolved measurement of competitiveness and its drivers to give more relevant guidance to policymakers and

public-private dialogues. The World Economic Forum has been working on modernizing the GCI over the past two years. In the 2015-2016 edition of The Global Competitiveness Report (GCR), the first reflections from this process were published, providing a thorough literature review of competitiveness drivers,6 as well as a preliminary methodology for the new Index. Since last year's Report the Forum's thinking has advanced further to identify five clear directions for measuring competitiveness during the rise of the Fourth Industrial Revolution.

First, productivity remains a key driver of prosperity. Although measuring productivity has become more complex, economists have little doubt

Box 2: The global productivity slowdown: Five hypotheses

Since Robert Solow identified technology as a driver of growth in the 1950s,¹ productivity has been developing hand in hand with innovation. In recent years, innovations such as big data, FinTech, the sharing economy, and other ICT-enabled services, and also advances in science and technology, including in biotechnology, new materials, and artificial intelligence, are expanding. Yet, in the vast majority of global regions, productivity growth has slowed since the global financial crisis: the last decade was the first since World War II where productivity growth stagnated or declined, as shown in The Global Competitiveness Report 2015-2016. What could explain this paradox? There are five main hypotheses.

- 1. Technology has yet to show its full impact on productivity. We need time to re-invent our organizations, laws, and rules to fully leverage new technologies. For investments in digital technologies to be viable, firms need to simultaneously reform many business processes and equip workers with new skills; it they do not, the combination of new technologies and insufficient people who can use them will create new inefficiencies. In some cases, a governance vacuum prevents some of the more advanced technologies, such as self-driving cars and drones, from being translated into reality. In other cases, we recognize the potential of new technologies but do not yet know how best to deploy them. Only now are companies emerging with new business models for goods and services in fields such as transportation, energy, and healthcare; truly reinventing fields such as banking and education will take more time.
- 2. The way we measure productivity underestimates improvements. Productivity measurements capture only monetary transactions, so non-monetary transactions (e.g., those initiated in the sharing economy) may not be captured. We may not be able to measure spreading free digital services correctly-how do we account for the output of companies such as Google or Wikipedia or for the matchmaking efficiency achieved by Etsy or Airbnb? And how do we measure cross-border trade in data? In the same way, qualitative improvements to products and services are equally inherently difficult to capture in national accounts and have arguably been taking place faster in recent years. However, recent research highlights the idea that mis-measurement is not telling the whole story.²

- 3. Innovation today may not be as all-encompassing and or groundbreaking as it has been in the past. Economist Robert Gordon argues that, compared with innovations in the 19th century (such as the steam engine, electric lights, and sewerage) that had a quick and pervasive impact on people's lives, today's innovations (such as social media and smartphones) may not yet have a similar level of impact and hence their impact on productivity is incremental.³
- 4. Hysteresis effects may have emerged following the financial crisis. As outlined by economist Nouriel Roubini, protracted recessions—such as the one the global economy has been experiencing since 2007-can slow productivity growth for two reasons: because people who remain unemployed for a long time lose their skills and because slowing investment prevents the latest technologies embedded in capital goods from being used.4
- 5. Rising inequality could slow down productivity growth. The rising inequality observed in past years could slow productivity growth further. If rising inequality reduces demand (the wealthy tend to spend less and the poor have less to spend), then productivity improvements will not lead to rising sales, and no resource re-allocation toward more productive sectors will take place. As a result, average productivity will not increase—it may even decrease.

More research is needed to understand the reasons behind the slowdown in productivity growth. Whatever the reasons, however, there is widespread agreement that productivity remains a key driver of growth and prosperity, which remain important for citizens' well-being. When growth is balanced and inclusive, pro-competitiveness reforms are key to ensuring rising standards of living and social stability.

of its central role in economic progress. Prosperity can increase only if inputs of production are used in smarter and more efficient ways to fulfill constantly evolving human demands. Therefore we still define competitiveness as the set of institutions, policies, and factors that determine the level of productivity of an economy, which in turn determines the level of prosperity a country can achieve.

Second, future orientation is central. Because technology disrupts the business landscape in unexpected ways and does this more quickly than it used to, the primary feature of successful economies will be their capacity to be agile, adapt to changes, and respond to shocks relatively smoothly and speedily. These aspects are meant to be captured by the education and skills, labor market, and goods market pillars that measure the extent to which a country's regulations and human capital support structural change and industrial revamp.

Third, the meaning of innovation is being updated. The capacity of a country to be innovative has to be thought of as an ecosystem that not only produces scientific knowledge but also enables all industriesincluding in the service sector—and society at large to be more flexible, interconnected, and open to new ideas and business models. This way of understanding innovation focuses on a country's ability to bring new products and services to market, and it attributes equal importance to non-technical and technical inventions. To be truly innovative, a country should not only file patents and support research and development in science and technology, but should also provide a networked, connected environment that promotes creativity and entrepreneurship, fosters collaboration, and rewards individuals who are open-minded and embrace new ways to perform tasks. In such an ecosystem the modernization of the educational framework also plays a pivotal role: it must offer life-long learning opportunities and teach students to think critically, collaborate with individuals of different backgrounds, and expose them to different points of view and ideas. Similarly, the financial sector needs to offer venture capital and new financing solutions suitable for smaller or riskier projects, as well as leverage information and communication technologies (ICT) platforms, such as what today is known as FinTech.

Fourth, ICT infrastructure is an imperative. As ICT-based business models become more prevalent, countries that fail to transition to a digital economy will be at a substantial competitive disadvantage, not only commercially but also in terms of innovation. Hence the technology adoption, business agility, and innovation capacity pillars have been reformed, considering them to be all part of the innovation ecosystem. ICT infrastructure measures have also been added to the infrastructure pillar as they now play a prerequisite role for development as much as transport infrastructure.

Fifth, the world is leveled more than it used

to be. The current GCI model assumes that a country's priorities evolve as it develops, with infrastructure, institutions, macroeconomic stability, and basic health and education more important for lower-income countries and innovation and business sophistication more important for higher-income countries. The Fourth Industrial Revolution makes it reasonable to take a more agnostic approach and recognize that all competitiveness factors matter for countries at all income levels and the exercise of policy prioritization is more complex than we have so far believed. For example, robotics is making light manufacturing less labor-intensive, which reduces the feasibility of lowerincome countries developing by leveraging unskilled labor. However, because ICTs enable the rapid transfer of ideas and technologies, they also make innovation less capital-intensive, offering those countries new ways to develop. The updated GCI will reflect this conceptual change and weight all 12 pillars equally for all countries. We assume that a country's development priorities are country-specific rather than determined by their income level. Defining policy priorities is a country-specific exercise that will be better informed by the updated GCI (see Box 3).

In addition to these new conceptual underpinnings, the methodology needs to keep up with new indicators that have become available, notably for health and financial development. On health, the disability-adjusted life year summarizes all available information on the extent of mortality and disability due to communicable and non-communicable diseases and is, therefore, a more accurate measure of the health component of human capital than life expectancy or the prevalence of malaria, tuberculosis, and HIV. On finance, new metrics on depth, liquidity, soundness, and access to the banking sector have started to become more available for a larger set of countries since the global financial crisis.

These changes in the GCI methodology are a natural evolution of the current framework rather than a completely new approach. The overall structure of 12 pillars remains relevant because it captures general concepts that are important for any type of marketbased society: good governance, infrastructure, education, and functioning markets will continue to determine how successfully economic systems can cope with technological and societal revolutions, but they will do so in different ways. For example, institutions will not only have to protect property rights, security, and rule of law, but they also have to become more forward looking, updating regulations to prevent potential misuse of new technologies while nurturing a dynamic business environment; countries will need to build "data highways" as well as roads and ports; and financial sectors will need to support industrial restructuring and innovation.

Box 3: How to prioritize policies to overcome the "middle-income trap": An empirical exercise for Latin America and the Caribbean

Historically, the Global Competitiveness Index (GCI) has pointed toward one major way to prioritize policy reforms: dividing the Index into three subindexes (basic requirements, efficiency enhancers, and innovation and sophistication factors) while also classifying countries into three groups according to per capita income. For lower-income countries, a higher weight is given to basic requirements; for the middleincome group, the priority is efficiency enhancers; for higherincome countries, the focus is on improving innovation and sophistication.

However, as the World Economic Forum revises the Global Competitiveness Index, other ways to contribute to the debate about policy prioritization to boost inclusive growth in emerging and developing markets and industrialized countries alike are being looked at-a debate that is especially urgent as the Fourth Industrial Revolution disrupts patterns of development and opens new paths to development. Following a session at the World Economic Forum on Latin America 2016, the Forum and the OECD Development Centre are exploring new methodologies to identify policy priorities in the region by combining GCI data with recent OECD Development Centre research.

For Latin America, an especially challenging scenario is the "middle-income trap": it is common for countries to grow rapidly in their early stages of development, only to stagnate when they approach middle levels of per capita income. Different sources of growth become more important at this stage, and countries can struggle to prioritize the right policies to make the necessary adjustments. In the region, only Argentina, Chile, and Uruguay have overcome the middle-income trap or are close to doing so.² Several other Latin American countries were already in the middleincome range as early as 1950, but these countries have not advanced beyond that range, and the region's average per capita income growth has remained weak in comparison to the OECD average (see Figure 1).

Figure 1: Middle-income countries: Latin America and the Caribbean compared to OECD

GCP per capita, constant 1990 PPP dollars

Source: OECD Development Centre calculations, based on Felipe et al. 2012. Data were extracted from the International Monetary Fund's World Economic Outlook Database (April 2016), https://www.imf.org/external/data.htm, and the Maddison Project (2010) database, http://www.ggdc.net/maddison/.

Whether a country falls into or escapes from the middleincome trap depends on a range of many variables, from its general economic and legal environment and macroeconomic stability to integration and the effectiveness of productive development policies. The OECD Development Centre conducted empirical research to shed light on the most important policy areas, statistically analyzing the experiences of emerging economies and the OECD countries that have graduated to higher-income status since 1985. The Centre defines middle-income as between US\$2,000 and US\$11,750, measured in 1990 constant levels and adjusted for PPP. as in Felipe et al. (2012). Using fixed thresholds at constant PPP prices allows us to compare the current characteristics of middle-income Latin American economies to those of countries at the time they graduated to high-income status: Israel (1986), Singapore (1988), Ireland (1990), Spain (1990), the Republic of Korea (1995), Portugal (1996), Greece (2000), Chile (2005), Kuwait (2005), Qatar (2005), Uruguay (2012), Malaysia (2014), and Poland (2014).

The Centre uses linear discriminant analysis to find the linear combination of institutional and economic features—covering institutions, the structure of production, demographic variables, and macroeconomic indicators—that characterize countries that did and did not evade the middleincome trap.3

Preliminary results show that the variables that best separate these sets of countries are the rule of law, the index of productive capabilities, and investment. These policy areas seem to exhibit robust results, because most countries are correctly ascribed to their particular income category based on a larger group of growth determinants, not exclusively on per capita income.

The analysis also points to differing policy priorities for economies in Latin America and the Caribbean. For instance, Chile lags behind in terms of productive capabilities and the size of the manufacturing sector; in Mexico, improvements to the rule of law are highlighted; in Colombia and Peru, the challenges are linked to productive capabilities, the size of the manufacturing sector, public revenues, and the rule of law. The Forum and the OECD Development Centre are collaborating to extend this research by including new variables, broadening the country sample, and testing novel empirical methodologies.

Figure 2: The updated GCI framework

Enabling	environment	Hun	nan capital	M	larkets	Innovation ecosystem		
Institutions	Introduced new statistical measures of security and transparency	Health	Refocused from morbidity to disability-adjusted life years	Product market efficiency	Streamlined and simplified to focus on tariffs, antitrust, and taxation	Technology adoption	Improved ICT measures; more measures capturing non-ICT technologies	
Infrastructure	Included more measures of connectivity, ICT, energy, and water infrastructure	Education and skills	Restructured as current versus future skills of the labor force	Labor market functioning	Refocused on matching skills and capacity to support industry disruption	Market size	Rethought to capture market potential rewarding larger pools of ideas and economies of scale	
Macro- economic context	Added measures of external and foreign currency debt and improved conventional indicators			Financial market development	Using predominantly hard data, expanded regulatory and access aspects	Business dynamism	Rethought to capture entrepreneurial spirit entry and bankruptcy regulation	
						Innovation capacity	Combines R&D with non-R&D factors (e.g., creativity, connectivity, business models)	

Figure 2 summarizes the main changes to the GCI framework. These include centering the health pillar on disability-adjusted life years, rethinking market size as market potential, and reflecting the richer data now available in the financial pillar. The appendix fully describes all the indicators that are part of the updated methodology.

SELECTED ISSUES: DISCUSSION AND PRELIMINARY RESULTS

This section presents preliminary results on two subindexes that are particularly relevant in the context of the Fourth Industrial Revolution and that have been extensively reviewed—the human capital subindex and the innovation ecosystem subindex—as well as a new approximation to the weights given to pillars due to implications for policy prioritization.

Four subindexes

Moving away from the idea that countries move through sequential, defined stages of development implies that the methodology needs to be updated accordingly. The planned index will weight all 12 pillars equally for

all countries and the pillars will be grouped into four subindexes:7

- The enabling environment subindex measures whether countries have in place sound institutions, well-developed infrastructure, and strong macroeconomic conditions, which together determine the environment in which companies operate.
- The human capital subindex measures how the health and skills of the labor force contribute to a country's competitiveness.
- The markets subindex measures how firms can rely on product, labor, and financial markets to find the production inputs they need and how quickly and easily they can reorganize when the industry landscape changes.
- The innovation ecosystem subindex measures how technology adoption, business dynamism, and innovation capacity all influence the innovation

Table 1: Structure of the education and skills pillar

Skills of the current workforce

Mean years of schooling (UNESCO)

process. Using existing technology can give rise to new products and business models; countries where businesses are more open to new ideas are more likely to adopt the latest technologies faster and create new ones; and larger markets foster innovation because they enable economies of scale for new products and services.

Education and skills

At every level of schooling, the education system needs to teach competences that are relevant to the modern economy. Even lower-skilled jobs increasingly require talent and knowledge, so vocational training and secondary education need to equip people with the ability to work in a complex, digital environment. Because change occurs so quickly, there is a high level of uncertainty regarding the skills needed for the future.8 However, at all skill levels, individuals will be rewarded for the capacity to think critically, solve problems, and take advantage of new technologies. Schools will therefore need to teach flexible thinking rather than emphasizing memorization; they will need to show students how to cooperate and work with individuals with different backgrounds as well as to compete, and will need to nurture the ability to challenge, confront, and critically appraise differing ideas.

To capture these developments, the suggested education and skills pillar measures both the quantity and quality of skills and the training that today's workers possess, as well as the level of education and skills of tomorrow's workforce, with particular emphasis on the use of ICTs in school and the style of teaching. Measuring the skills of the current and future workforce together captures the dynamics of the workforce's skillset in each country, tracking whether the level of human capital is increasing or declining. Even the most advanced countries today could quickly lose their human capital advantage if their education systems fail to increase the quantity and quality of skills of their future professionals and entrepreneurs. Similarly, developing countries could see their investments in education generate decreasing returns if they do not manage to

update curricula and teaching styles. Table 1 shows the structure of the education and skills pillar.

Table 2 presents the preliminary results for this pillar. Denmark has the most sustainable system, with the skills of the current and future workforce both ranking in the top five. Denmark is one of the first countries to include computer science in its primary-school curriculum, together with the United Kingdom, Israel, New Zealand, and Australia. Finland and Iceland are among the advanced countries where the future workforce is expected to be better equipped than current workers, whereas Switzerland, Israel, and Japan are among those that may see their currently high level of human capital diminish going forward. Among emerging and developing economies, Brazil, China, Colombia, Rwanda, and Kenya are examples of countries improving the future skillset of their workforce, while countries with education systems that may see reductions in their future human capital include the Philippines, Panama, South Africa, and Nigeria, which already ranks as low as 123rd.

Innovation

According to the latest thinking, innovation occurs in an ecosystem where businesses, regulations, and social norms promote connectivity, creativity, entrepreneurship, collaboration, and the adoption of the latest technologies to generate new ideas and bring new products and business models to market. These concepts are measured by four pillars: technological adoption, market size, business dynamism, and innovation capacity.

The concepts measured by the latter two pillars, in particular, need to go hand in hand for a country to be considered an innovation powerhouse (Table 3). As long as new ideas cannot find a practical implementation they might contribute to knowledge accumulation but they do not immediately translate into advances in human welfare. In some cases finding a practical application for a new idea is just a matter of time, because technological progress in other fields has to occur before these ideas can be put into practical use. It is. however, crucial for a country to develop the skills and the conditions that can ignite the process of transforming abstract innovation into new products and processes.

Willingness to delegate authority (EOS)	Companies embracing disruptive ideas (EOS)	Capacity to commercialize new products (EOS)			

Note: For a full definition of variables and sources, see the appendix at the end of this chapter. EOS = Executive Opinion Survey.

Therefore the business dynamism pillar measures the extent to which regulations promote entrepreneurial mindset and business agility-for example, the ease of opening and closing a business and attitudes toward entrepreneurial risk.

Innovation capacity, in addition to measuring the accumulation of knowledge produced by formal research and patenting activity, also captures a country's capacity to encourage creativity, interaction, and collaboration between individuals and institutions; and the aptitude of its companies to commercialize new products. This way of thinking about innovation emphasizes how breakthrough ideas emerge from contrasting and applying concepts across diverse industries, cultures, departments, and disciplines.9 A similar process was observed during the Renaissance when the cultural environment provided the conditions for painters, sculptors, scientists, philosophers, financiers, and architects to influence each other's' work and produce remarkable progress in both arts and science.

Table 4 shows the preliminary country rankings on these two pillars. Switzerland, Sweden, the Netherlands, Germany, Denmark, and the United States are in the top 10 on both pillars. Others fall short in one or other dimension: for example, Italy and China rank above 40th for innovation capacity but below 60th for business agility. Japan and the Republic of Korea rank around 20th in both dimensions: although both countries score highly for patenting and research and development investment, their innovation ecosystem is limited by burdensome regulations and conservative social norms around entrepreneurial risk. Conversely, New Zealand ranks better for business dynamism than it does for innovation capacity. Because countries can be truly innovative only if all components of the ecosystem are in place, this analysis should help policymakers, businesses, and civil society to identify bottlenecks and prioritize interventions.

CONCLUSIONS

This chapter has explained the current status of the World Economic Forum's work to modernize the Global Competitiveness Index in light of the new reality brought about by the Fourth Industrial Revolution. We have presented preliminary results on the three most renovated pillars (education and skills, business dynamism, and innovation capacity).

The analysis of the preliminary results suggests that the competitiveness of advanced and emerging economies alike will rest on a country's future orientation and its ability to update skills, and on the regulations and social norms that promote entrepreneurship and welcome change, collaboration, and creativity.

As we continue to work to improve the Index, we invite users, policymakers, business executives, and the academic community to provide feedback on the components discussed above and the preliminary Index results presented in this chapter.¹⁰

NOTES

- 1 For a concise definition of the Fourth Industrial Revolution, see Box 1 of Chapter 1.1; see also Box 1 in this chapter. For a fuller description, see Schwab 2016.
- 2 IFR 2016.
- 3 Juniper Research 2016.
- 4 eMarketer 2016.
- 5 Roland Berger Strategy Consultants 2012.
- 6 For the full literature review, see Sala-i-Martín et al. 2015b.
- Technically, the index score will be calculated as a simple average of the 12 pillars. The four subindex's scores will be used for analysis but will not enter directly into the overall GCI score calculation. The organization of the pillars into four subindexes reflects therefore a conceptual representation of main areas of competitiveness, but does not determine the ranking.

Appendix: Updated Global Competitiveness Index Structure

The following table provides sources and descriptions for all the indicators composing the updated Global Competitiveness Index methodology to date. Although the World Economic Forum's effort to refine the measurement of competitiveness is ongoing, the indicators below represent the latest stage in benchmarking the concepts described in the chapter. Below is a description of each indicator or, in the case of Executive Opinion Survey data, the full question and associated answers.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
1st pillar: Institu	tions			
Property rights	EOS	In your country, to what extent are property rights, including financial assets, protected? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Intellectual property protection	EOS	In your country, to what extent is intellectual property protected? [1 = not at all; 7 = To a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Business costs of crime and violence	EOS	In your country, to what extent does the incidence of crime and violence impose costs on businesses? [1 = to a great extent, imposes huge costs; 7 = no costs at all]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Homicide rate	Non-EOS	Number of homicides per 100,000 population.	United Nations Office on Drugs and Crime (UNODC) Statistics, https://data. unodc.org/	2014
Organized crime	EOS	In your country, to what extent does organized crime (mafia-oriented racketeering, extortion) impose costs on businesses? [1 = to a great extent, imposes huge costs; 7 = no costs at all]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Terrorism incidence	Non-EOS	Index (1–7 best) averaging the number of terrorism-related casualties (injuries plus fatalities) and the number of terrorist attacks, each normalized separately.	World Economic Forum's calculations, based on data from the National Consortium for the Study of Terrorism and Responses to Terrorism (START) (2015), Global Terrorism Database http://www.start.umd.edu/gtd	2015
Reliability of police services	EOS	In your country, to what extent can police services be relied upon to enforce law and order? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Irregular payments in exports and imports	EOS	In your country, how common is it for companies to make undocumented extra payments or bribes in connection with the imports and exports [1 = very common; 7 = never occurs]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Irregular payments in public utilities	EOS	In your country, how common is it for companies to make undocumented extra payments or bribes in connection with the public utilities (e.g., telephone, electricity) [1 = very common; 7 = never occurs]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average

[†] EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
Irregular payments in tax collection	EOS	In your country, how common is it for companies to make undocumented extra payments or bribes in connection with tax payments [1 = very common; 7 = never occurs]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Irregular payments in public contracts	EOS	In your country, how common is it for companies to make undocumented extra payments or bribes in connection with awarding of public contracts and licenses [1 = very common; 7 = never occurs]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Irregular payments in judicial decisions	EOS	In your country, how common is it for companies to make undocumented extra payments or bribes in connection with obtaining favorable judicial decisions [1 = very common; 7 = never occurs]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Diversion of public funds	EOS	In your country, how common is illegal diversion of public funds to companies, individuals or groups? [1 = very commonly occurs; 7 = never occurs]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Favoritism in decisions of government officials	EOS	In your country, to what extent do government officials show favoritism to well-connected firms and individuals when deciding upon policies and contracts? [1 = show favoritism to a great extent; 7 = do not show favoritism at all]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Open budget survey	Non-EOS	Index (0–100) of central government budget transparency. It is calculated by averaging the score of 109 questions assessing the ease of access to and timeliness of information on eight key budget documents.	The International Budget Partnership, http://survey. internationalbudget. org/#timeline	2015
Judicial independence	EOS	In your country, how independent is the judicial system from influences of the government, individuals, or companies? [1 = not independent at all; 7 = entirely independent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Efficiency of legal framework in challenging regulations	EOS	In your country, how easy is it for private businesses to challenge government actions and/or regulations through the legal system? [1 = extremely difficult; 7 = extremely easy]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
World Press Freedom	Non-EOS	Index (0–100 worst) measures media independence, the quality of the infrastructure that supports the production of news, and information and acts of violence against journalists. It is based on two instruments: a database of the level of abuses and violence against journalist and media; and an expert opinion survey on pluralism, media independence, self-censorship, transparency, and infrastructure in each country.	Reporters without Borders, https://rsf.org/en/ranking	2016
Burden of government regulation	EOS	In your country, how burdensome is it for companies to comply with public administration's requirements (e.g., permits, regulations, reporting)? [1 = extremely burdensome; 7 = not burdensome at all]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Government online Service	Non-EOS	Index (0–1 best) that measures the scope and quality of government's online services.	United Nations Department of Economic and Social Affairs (UNDESA), UN E-Government Development Index, https://publicadministration.un.org/egovkb/en-us/Data-Center	2014
Efficiency of legal framework in settling disputes	EOS	In your country, how efficient are the legal and judicial systems for companies in settling disputes? [1 = extremely inefficient; 7 = extremely efficient]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
Efficiency in provision of public goods and services	EOS	In your country, how efficient is the government in providing public goods and services? [1 = extremely inefficient; 7 = extremely efficient]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Government ensuring policy stability	EOS	In your country, to what extent does the government ensure a stable policy environment for doing business? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Workers' rights	Non-EOS	Index (0–97 worst) measures the level of protection of internationally recognized core labor standards including civil rights, the right to bargain collectively, the right to strike, the right to associate freely, and access to due process rights. It does not take into account any element of firing regulations.	International Trade Union Confederation, Global Rights Index 2016, http:// survey.ituc-csi.org/ITUC- Global-Rights-Index.html	2015
Ethical behavior of firms	EOS	In your country, how do you rate the corporate ethics of companies (ethical behavior in interactions with public officials, politicians, and other firms)? [1 = extremely poor—among the worst in the world; 7 = excellent—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Strength of auditing and accounting standards	EOS	In your country, how strong are financial auditing and reporting standards? [1 = extremely weak; 7 = extremely strong]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Efficacy of corporate boards	EOS	In your country, to what extent is management accountable to investors and boards of directors? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Extent of conflict of interest regulation	Non-EOS	Index (0–10 best) that measures the level of protection of shareholders against directors' misuse of corporate assets for personal gain. It is an average of three sub-indexes: an index of transparency of transactions, an index of director liability, and an index of shareholders' ability to sue officers and directors for misconduct.	World Bank/International Finance Corporation, <i>Doing Business 2016: Measuring Regulatory Quality and Efficiency,</i> http://www.doingbusiness.org/	2015
Extent of shareholder governance	Non-EOS	Index (0–10 best) that measures the level of shareholders' right in corporate boards. It is an average of three sub-indexes: an index of the role of shareholders in major corporate decisions, an index of the extent of safeguards against undue board control and entrenchment, and an index of corporate transparency.	World Bank/International Finance Corporation, <i>Doing</i> <i>Business 2016: Measuring</i> <i>Regulatory Quality and</i> <i>Efficiency,</i> http://www. doingbusiness.org/	2015
2nd pillar: Infras	tructure and	connectivity		
Road straightness	Non-EOS	Average of two distance measures: the first measure is the ratio between the length of the street to connect the 10 largest cities in a country and their crow-fly distances. The second measure is the ratio between the length of the street to connect the most north, south, east, and west points of a country and their crow-fly distances.	World Economic Forum's calculations, based on Open Street Maps and Google Directions data	2015
Road speed	Non-EOS	Average of two speed measures: the average speed to connect the 10 largest cities in a country in a non-optimized itinerary, and the average speed to connect the most north, south, east, and west points of a country.	World Economic Forum's calculations, based on Open Street Maps and Google Directions data	2015
Quality of road infrastructure	EOS	In your country, how is the quality (extensiveness and condition) of transport infrastructure for roads [1 = extremely underdeveloped—among the worst in the world; 7 = extensive and efficient—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
Efficiency of ground transportation	EOS	In your country, how efficient (i.e., frequency, punctuality, speed, price) are the following transport services? a. Ground transportation (buses, subways, taxis) [1 = extremely inefficient—among the worst in the world; 7 = extremely efficient—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Railroad density	Non-EOS	Kilometers of railroad per 100 square kilometers of land.	World Bank, World Development Indicators (WDI), http://data. worldbank.org/	2014
Quality of railroad infrastructure	EOS	In your country, how is the quality (extensiveness and condition) of transport infrastructure for railroads [1 = extremely underdeveloped—among the worst in the world; 7 = extensive and efficient—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Efficiency of train services	EOS	In your country, how efficient (i.e., frequency, punctuality, speed, price) are the train services [1 = extremely inefficient—among the worst in the world; 7 = extremely efficient—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Air connectivity	Non-EOS	Index that measures air connectivity, capturing the full range of interactions among all air transport network nodes, even when there is no direct flight connection between them.	World Bank, http:// documents.worldbank. org/curated/ en/2011/06/14491791/ air-connectivity-index- measuring-integration- global-air-transport-network	2007
Quality of airport nfrastructure	EOS	In your country, how is the quality (extensiveness and condition) of air transport [1 = extremely underdeveloped—among the worst in the world; 7 = extensive and efficient—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Efficiency of air transport services	EOS	In your country, how efficient (i.e., frequency, punctuality, speed, price) are air transport services [1 = extremely inefficient—among the worst in the world; 7 = extremely efficient—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
iner shipping connectivity	Non-EOS	Index (0–100 best) of how well countries are connected to global shipping networks. It is based on five components of the maritime transport sector: the number of ships, their container-carrying capacity, the maximum vessel size, the number of services, and the number of companies that deploy container ships in a country's ports.	United Nations Conference on Trade and Development (UNCTAD) Statistics, http:// unctadstat.unctad.org/ wds/TableViewer/tableView. aspx?ReportId=92	2016
Quality of seaport nfrastructure	EOS	In your country, how is the quality (extensiveness and condition) of seaports (for landlocked countries, assess access to seaports) [1 = extremely underdeveloped—among the worst in the world; 7 = extensive and efficient—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Efficiency of seaport services	EOS	In your country, how efficient (i.e., frequency, punctuality, speed, price) are seaport services (ferries, boats) (for landlocked countries, assess access to seaport services) [1 = extremely inefficient—among the worst in the world; 7 = extremely efficient—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Electrification rate	Non-EOS	Share of population with access to electricity.	World Bank, World Development Indicators (WDI), http://data. worldbank.org/	2012
Electric power losses	Non-EOS	Electric power transmission and distribution losses as a percentage of output. Electric power transmission and distribution losses include losses in transmission between sources of supply and points of distribution and in the distribution to consumers, including pilferage.	World Bank, World Development Indicators (WDI), http://data. worldbank.org/	2013

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
Quality of electricity supply	EOS	In your country, how reliable is the electricity supply (lack of interruptions and lack of voltage fluctuations)? [1 = extremely unreliable; 7 = extremely reliable]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Reliability of water supply	EOS	In your country, how reliable is the water supply (lack of interruptions and flow fluctuations)? [1 = extremely unreliable; 7 = extremely reliable]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Access to improved drinking water	Non-EOS	Percentage of the population using an improved drinking water source (i.e., piped water or protected wells and springs).	World Bank, World Development Indicators (WDI), http://data. worldbank.org/	2015
Mobile network coverage rate	Non-EOS	Share of the population covered by a mobile-cellular network.	International Telecommunication Union (ITU), World Telecommunication/ICT Indicators Database 2016 (20th edition/June 2016)	2015
3rd pillar: Macro	oeconomic co	ontext		
Debt coverage ratio	Non-EOS	General government gross debt as a percentage of general government revenue	World Economic Forum's calculations, based on International Monetary Fund (IMF), World Economic Outlook (April 2016 edition), http://www.imf.org/weo	2015
Government budget balance	Non-EOS	Average of general government budget balance over 10 years, calculated as the general government revenue minus total expenditure, as a percentage of GDP.	International Monetary Fund (IMF), World Economic Outlook (April 2016 edition), http://www.imf.org/weo	2006–2015 average
Government debt in foreign currency	Non-EOS	Gross general government debt borrowed in foreign currency as a percentage of gross general government debt.	World Bank, Quarterly Public Sector Debt (QPSD) database; and International Monetary Fund (IMF), World Economic Outlook, http:// data.worldbank.org/data- catalog/quarterly-public- sector-debt and http:// www.imf.org/weo	2015
Government external debt	Non-EOS	Gross general government debt owned by foreign creditors in local or foreign currency as a percentage of gross general government debt.	World Bank, Quarterly Public Sector Debt (QPSD) database; and International Monetary Fund (IMF), World Economic Outlook, http:// data.worldbank.org/data- catalog/quarterly-public- sector-debt and http:// www.imf.org/weo	2015
Gross national savings	Non-EOS	Gross national savings as a percentage of GDP. Gross national savings is defined as gross disposable income less final consumption expenditure after taking account of an adjustment for pension funds. For many countries, the estimates of national savings are built up from national accounts data on gross domestic investment and from balance of payments-based data on net foreign investment.	International Monetary Fund (IMF), World Economic Outlook (April 2016 edition), http://www.imf.org/weo	2015
Inflation	Non-EOS	Annual percent change in the consumer price index (year average)	International Monetary Fund (IMF), World Economic Outlook (April 2016 edition), http://www.imf.org/weo	2015

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
4th pillar: Health				
DALYs	Non-EOS	DALY (disability-adjusted life year) measures the number of "healthy" life years lost in the population aged between 15 and 69 years old due to diseases or injuries. It is the gap between current health status and an ideal health situation where the entire population lives to an advanced age, free of disease and disability. A DALY is calculated for each of a large set of diseases or health conditions as the sum of the years of life lost (YLL) due to premature mortality in the population and years lost due to disability (YLD) for people living with that health condition or its consequences.	Institute for Health Metrics and Evaluation (IHME)	2013
Infant mortality	Non-EOS	Number of infants dying before reaching one year of age per 1,000 live births in a given year.	World Bank, World Development Index, http:// data.worldbank.org/	2015
Business cost of health-related absence	EOS	In your country, to what extent does health-related absence cost on businesses (consider both communicable and non-communicable diseases)? [1 = to a great extent; 7 = not at all]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
5th pillar: Educa				
A. Skills of the of Mean years of schooling	Non-EOS	Average number of completed years of education of a country's population aged 25 years and older. The value is converted from education attainment levels using official durations of each level; it excludes years spent repeating individual grades.	verage number of completed years of education of country's population aged 25 years and older. The statistics, http://data.uis. unesco.org/ sing official durations of each level; it excludes	
Extent of staff training	EOS	In your country, to what extent do companies invest in training and employee development? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Quality of vocational training	EOS	In your country, how do you assess the quality of vocational training? [1 = extremely poor—among the worst in the world; 7 = excellent—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Skillset of secondary- education graduates	EOS	In your country, to what extent do graduating students from secondary education possess the skills needed by businesses? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Skillset of university graduates	EOS	In your country, to what extent do graduating students from university possess the skills needed by businesses? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
B. Skills of the f	uture workfor	ce		
School life expectancy	Non-EOS	Total number of years of schooling (primary through tertiary) that a child can expect to receive, assuming that the probability of his or her being enrolled in school at any particular future age is equal to the current enrollment ratio at that age.	UNESCO Institute for Statistics, http://data.uis. unesco.org/	2014
Quality of primary education	EOS	In your country, how do you assess the quality of primary schools [1 = extremely poor—among the worst in the world; 7 = excellent—among the best in the world]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Internet use in schools	EOS	In your country, to what extent is the Internet used in schools for learning purposes? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Critical thinking in teaching	EOS	In your country, how do you assess the style of teaching? [1 = frontal, teacher based, and focused on memorizing; 7 = encourages creative and critical individual thinking]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
6th pillar: Produ	ct market effi	ciency		
Extent of market dominance	EOS	In your country, how do you characterize corporate activity? [1 = dominated by a few business groups; 7 = spread among many firms]	tivity? [1 = dominated by a few business groups; Executive Opinion Survey.	
Effectiveness of antitrust policy	EOS	In your country, how effective are anti-monopoly policies at ensuring fair competition? [1 = not effective at all; 7 = extremely effective]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Competition in professional services	EOS	In your country, how competitive are the provisions of professional services (legal services, accounting, engineering, etc.) [1 = not at all competitive; 7 = extremely competitive]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Competition in retail services	EOS	In your country, how competitive are the provision of the retail services [1 = not at all competitive; 7 = extremely competitive]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Competition in network services	EOS	In your country, how competitive are the provisions of the network sector services (telecommunications, utilities, postal, transport, etc.) [1 = not at all competitive; 7 = extremely competitive]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Prevalence of non-tariff barriers	EOS	In your country, to what extent do non-tariff barriers (e.g., health and product standards, technical and labeling requirements, etc.) limit the ability of imported goods to compete in the domestic market? [1 = strongly limit; 7 = do not limit at all]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Trade tariffs	Non-EOS	Trade-weighted average applied tariff rate. An applied tariff is a customs duty that is levied on imports of merchandise goods, calculated as a weighted average of all the applied tariff rates, including preferential rates that a country applies to the rest of the world. The weights are determined for each of the reference groups defined by the International Trade Centre (ITC). They are calculated on the basis of the trade patterns (volume of imports of each product category) of the importing country's reference group.	International Trade Centre, Trade Competitiveness Map database, http:// legacy.intracen.org/appli1/ tradecom/TPIC.aspx	2015
Complexity of tariffs	Non-EOS	Index (1–7 best) that measures the complexity of a country's tariff regime based on three criteria: tariff dispersion, the prevalence of tariff peak and specific tariffs, and the number of distinct tariffs.	World Economic Forum, The Global Enabling Trade Report 2014, based on data from UNCTAD and WTO	2013
Burden of customs procedures	EOS	In your country, how efficient are customs procedures (related to the entry and exit of merchandise)? [1 = extremely inefficient; 7 = extremely efficient]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Service trade restrictiveness	Non-EOS	Index (0–100 worst) assessing the overall openness of the service sector of a country for five major services sectors (financial services, telecommunications, retail distribution, transportation, professional services) and three modes of supply (cross-border supply of services, supply of services through commercial presence (or FDI), and temporary presence of natural persons)	tor of a country rs (financial s, retail distribution, services) and three der supply of services, commercial presence (or	
Total non-labor tax rate	Non-EOS	Sum of profit tax and other taxes (percent of profits) paid by businesses	World Economic Forum's calculations, based on World Bank/International Finance Corporation, <i>Doing Business 2016: Measuring Regulatory Quality and Efficiency</i> , http://www.doingbusiness.org/	2015

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence	
Distortive effect on competition of taxes and subsidies	EOS	In your country, to what extent do fiscal measures (subsidies, tax breaks, etc.) distort competition? [1		2015–2016 weighted average	
7th pillar: Labor	market funct	tioning			
Redundancy costs	Non-EOS	Cost (in weekly wages) of advance notice requirements, severance payments, and penalties due when terminating a redundant worker.	ents, and penalties Finance Corporation;		
Hiring and firing practices	EOS	In your country, to what extent do regulations allow flexible hiring and firing of workers? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average	
Cooperation in labor-employer relations	EOS	In your country, how do you characterize labor- employer relations? [1 = generally confrontational; 7 = generally cooperative]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average	
Flexibility of wage determination	EOS	In your country, how are wages generally set? [1 = by a centralized bargaining process; 7 = by each individual company]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average	
Active labor policies	EOS	In your country, to what extent do labor market policies help unemployed people to reskill and find new employment (including skills matching, retraining, etc.)? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average	
Ease of finding skilled employees	EOS	In your country, to what extent can companies find people with the skills required to fill their vacancies? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average	
Ease of hiring foreign labor	EOS	In your country, how restrictive are regulations related to the hiring of foreign labor? [1 = highly restrictive; 7 = not restrictive at all]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average	
Internal labor mobility	EOS	In your country, to what extent do people move to other parts of the country for professional reasons? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average	
Reliance of professional management	EOS	In your country, who holds senior management positions in companies? [1 = usually relatives or friends without regard to merit; 7 = mostly professional managers chosen for merit and qualifications]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average	
Pay and productivity	EOS	In your country, to what extent is pay related to employee productivity? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average	
Female wage and salaried workers	Non-EOS	Percentage of women aged 15–64 participating in the labor force as wage and salaried workers divided by the percentage of men aged 15–64 participating in the labor force as wage and salaried workers.	World Economic Forum's calculations, based on International Labor Organization, www.ilostat.	2013	
Total tax on Non-EOS The amount of taxes and mandatory contributions on labor paid by the business as a percentage of commercial profits.		World Bank/International Finance Corporation, <i>Doing</i> <i>Business 2016: Measuring</i> <i>Regulatory Quality and</i> <i>Efficiency,</i> http://www. doingbusiness.org/	2015		

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
8th pillar: Financ	cial market de	evelopment		
Domestic credit to private sector	Non-EOS	Ratio of financial resources provided to the private sector by financial corporations to GDP. Financial resources are loans, purchases of non-equity securities, and trade credits and other accounts receivable that establish a claim for repayment. It is a measure of depth of the credit market.	World Bank, World Development Indicators (WDI), http://data. worldbank.org/	2015
Financing of SMEs	EOS	In your country, to what extent can small- and medium-sized enterprises (SMEs) access finance they need for their business operations through the financial sector? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Venture capital availability	EOS	In your country, how easy is it for start-up entrepreneurs with innovative but risky projects to obtain equity funding? [1 = extremely difficult; 7 = extremely easy]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Corporate bond issuance volume	Non-EOS	Ratio of new corporate bond issuance as a percentage of GDP. This takes into account only bonds issued by private entities, excluding finance, holding companies, and insurance companies. It is a measure of the depth of the bond market.	World Bank, Global Financial Development Database, http://www. worldbank.org/en/ publication/gfdr/data/global- financial-development- database	2014
Financing through the equity market	EOS	In your country, to what extent can companies raise money by issuing shares and/or bonds on the capital market? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Market capitalization of listed companies	Non-EOS	Total value of listed companies to GDP. The total value is calculated as the price of all listed domestic companies multiplied by the number of their outstanding shares. It is a measure of the depth of the equity market.	World Bank, World Development Indicators (WDI), http://data. worldbank.org/	2015
Soundness of banks	EOS	In your country, how do you assess the soundness of banks? [1 = extremely low—banks may require recapitalization; 7 = extremely high—banks are generally healthy with sound balance sheets]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Bank nonperforming loans	Non-EOS	Value of nonperforming loans divided by the total value of the loan portfolio (including nonperforming loans before the deduction of specific loanloss provisions). It measures one aspect of the soundness of the banking sector and credit crunch.	World Bank, World Development Indicators (WDI), http://data. worldbank.org/	2015
Credit gap	Non-EOS	Difference between the most recent domestic credit to private sector (as a share to GDP) and its 20-year trend. It is a measure of the build-up of financial vulnerabilities.	World Economic Forum's calculations, based on World Bank, World Development Indicators, http://data.worldbank.org/	2015
Regulation of security exchanges	EOS	In your country, to what extent do regulators ensure the stability of the financial sector? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Share of asset held by top 5 banks	Non-EOS	Assets of the five largest banks as a share of total assets of commercial banks. Assets include total earning assets, cash and due from banks, foreclosed real estate, fixed assets, goodwill, other intangibles, current tax assets, deferred tax, discontinued operations, and other assets. It is a measure of concentration of the banking sector.	World Bank, Global Financial Development Database, http://www. worldbank.org/en/ publication/gfdr/data/global- financial-development- database	2014

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
Banks' liquid assets ratio	Non-EOS	Ratio of the value of liquid assets of banks to their short-term funding plus total deposits. <i>Liquid assets</i> are cash, trading securities at fair value through income, loans and advances to banks, reverse repos and cash collaterals. Deposits and short-term funding includes total customer deposits (current, savings, and term) and short-term borrowing (money market instruments, certificates of deposit, and other deposits). It is a measure of the liquidity of the banking sector.	World Bank, <i>Global</i> Financial Development Database, http://www. worldbank.org/en/ publication/gfdr/data/global- financial-development- database	2014
Banks' regulatory capital ratio	Non-EOS	Ratio of total regulatory capital of banks to their assets, weighted according to the risk of those assets. It measures one aspect of banks' solidity.	World Bank, Global Financial Development Database, http://www. worldbank.org/en/ publication/gfdr/data/global- financial-development- database	2014
Share of adults with a bank account	Non-EOS	Percentage of population 15 year old or older who have an account. It is a measure one aspect of individuals' access to finance.	World Bank, Global Findex, http://databank. worldbank.org/data/reports. aspx?source=1228#	2014
Commercial bank branches	Non-EOS	Number of commercial bank branches per 100,000 adults. Commercial bank branches are retail locations of resident commercial banks and other resident banks that function as commercial banks that provide financial services to customers and are physically separated from the main office but not organized as legally separated subsidiaries. It measures an aspect of access to finance complementary to number of adults with a bank account.	umber of commercial bank branches per 100,000 dults. Commercial bank branches are retail dults. Commercial bank branches are retail Development Indicators (WDI), http://data. worldbank.org/ at provide financial services to customers and e physically separated from the main office but ot organized as legally separated subsidiaries. measures an aspect of access to finance pmplementary to number of adults with a bank	
Depth of credit information	Non-EOS	Index (0–8 best) measuring the coverage, scope, and accessibility of credit information. It assesses the rules and practices to access information available in public credit registry or a private credit bureau.	World Bank/International Finance Corporation, <i>Doing</i> <i>Business 2016: Measuring</i> <i>Regulatory Quality and</i> <i>Efficiency</i> , http://www. doingbusiness.org/	2015
Strength of legal rights	Non-EOS	Index (0–12 best) measuring the protection of borrowers' and lenders' rights through collateral and bankruptcy laws. It is a measure of ease of lending.	World Bank/International Finance Corporation, <i>Doing</i> <i>Business 2016: Measuring</i> <i>Regulatory Quality and</i> <i>Efficiency</i> , http://www. doingbusiness.org/	2015
Public credit registry coverage	Non-EOS	Number of individuals and firms listed in a public credit registry with information on their borrowing history from the past five years as a percentage of the total adult population of 15 years old or older.	World Bank/International Finance Corporation, <i>Doing</i> <i>Business 2016: Measuring</i> <i>Regulatory Quality and</i> <i>Efficiency,</i> http://www. doingbusiness.org/	2015
Private credit bureau coverage	Non-EOS	Number of individuals and firms listed by a private credit bureau with information on their borrowing history from the past five years as a percentage of the total adult population of 15 years old or older.	World Bank/International Finance Corporation, <i>Doing</i> <i>Business 2016: Measuring</i> <i>Regulatory Quality and</i> <i>Efficiency,</i> http://www. doingbusiness.org/	2015
9th pillar Techno	ology adoptio	n		
Share of machinery and technology products in trade	Non-EOS	Ratio of trade of machinery and technology to total trade. The numerator is the sum of imports and exports relative to codes 8311, 84, 85, 90, using HS 2012 classification. The denominator is the sum of imports and exports. It is a proxy of technology adoption.	World Economic Forum's calculations, based on COMTRADE 2012–2015	2012–2015 average

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
Firm-level technology adoption	EOS	In your country, to what extent do businesses adopt the latest technologies? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
FDI and technology transfer	EOS	To what extent does foreign direct investment (FDI) bring new technology into your country? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
FDI greenfield investment	Non-EOS	Average over the five most recent available years of the absolute value in US dollars of greenfield foreign direct investments received by each country.	te value in US dollars of greenfield foreign on Trade and Development	
ICT use for business- to-business transactions	EOS	In your country, to what extent do businesses use ICTs for transactions with other businesses? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Internet use for business- to-consumer transactions	EOS	In your country, to what extent do businesses use the Internet for selling their goods and services to consumers? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Mobile-cellular telephone subscriptions	Non-EOS	Number of mobile-cellular telephone subscriptions per 100 population. It includes postpaid subscriptions, active prepaid accounts (i.e., that have been active during the past three months), and all mobile-cellular subscriptions that offer voice communications.	International Telecommunication Union (ITU), World Telecommunication/ICT Indicators Database 2016 (20th edition/June 2016)	2015
Fixed- broadband Internet subscriptions	Non-EOS	Number of fixed-broadband Internet subscriptions per 100 population. It refers to subscriptions for high-speed access to the public Internet (a TCP/IP connection). It includes cable modem, DSL, fiber, and other fixed (wired)-broadband technologies—such as Ethernet LAN, and broadband over powerline (BPL) communications.	International Telecommunication Union (ITU), World Telecommunication/ICT Indicators Database 2016 (20th edition/June 2016)	2015
Mobile- broadband subscriptions	Non-EOS	Number of active mobile-broadband subscriptions per 100 population. It includes standard mobile-broadband subscriptions and dedicated mobile-broadband data subscriptions to the public Internet	International Telecommunication Union (ITU), World Telecommunication/ICT Indicators Database 2016 (20th edition/June 2016)	2015
Fiber Internet subscriptions	Non-EOS	Number of Internet subscriptions using fiber-to-the-home or fiber-to-the-building; at downstream speeds equal to or greater than 256 kbit/s per 100 population. It includes subscriptions where fiber goes directly to the subscriber's premises or fiber-to-the-building subscriptions that terminate no more than 2 meters from an external wall of the building. Fiber-to-the-cabinet and fiber-to-the-node are excluded.	International Telecommunication Union (ITU), World Telecommunication/ICT Indicators Database 2016 (20th edition/June 2016)	2014
10th pillar: Mark	cet size			
Real market potential	Non-EOS	Size of domestic and foreign markets measured as an expenditure-weighted average of market access including own domestic demand. Estimated based on the results of a gravity equation.	World Economic Forum's calculations, based on the <i>United Nations Commodity Trade Statistics Database</i> (UN COMTRADE) and CEEPI gravity dataset	2015

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

11th pillar: Busii	ness dynamis	sm		
Cost required to start a business	Non-EOS	Ratio of total cost to start a business to the economy's income per capita. <i>Total cost</i> includes all official fees and fees for legal or professional services if such services are required by law or commonly used in practice.	come per capita. <i>Total cost</i> includes s and fees for legal or professional ch services are required by law or Finance Corporation, <i>Doing</i> Business 2016: Measuring Regulatory Quality and	
Time required to start a business	Non-EOS	Number of days required to start a business. This is the median duration that incorporation lawyers indicate is necessary to complete a procedure with minimum follow-up with government agencies and no extra payments.	on that incorporation lawyers y to complete a procedure with Finance Corporation, Doing Business 2016: Measuring	
Cost of bankruptcy proceedings	Non-EOS	The average cost of bankruptcy proceedings as a percentage of the estate's value.	World Bank/International Finance Corporation, <i>Doing</i> <i>Business 2016: Measuring</i> <i>Regulatory Quality and</i> <i>Efficiency,</i> http://www. doingbusiness.org/	2015
Strength of insolvency framework	Non-EOS	Index (0–16 best) measuring the adequacy and integrity of the legal framework applicable to liquidation and reorganization proceedings. This is based on four other indexes: the Commencement of proceedings index, the Management of debtor's assets index, the Reorganization proceedings index, and the Creditor participation index.	World Bank/International Finance Corporation, <i>Doing</i> <i>Business 2016: Measuring</i> <i>Regulatory Quality and</i> <i>Efficiency,</i> http://www. doingbusiness.org/	2015
Attitudes toward entrepreneurial risk	EOS	In your country, to what extent do people have an appetite for entrepreneurial risk? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Growth of innovative companies	EOS	In your country, to what extent do new companies with innovative ideas grow rapidly? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Willingness to delegate authority	EOS	In your country, to what extent does senior management delegate authority to subordinates? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
12th pillar: Innov	vation capaci	ity		
Internet users			2015	
Stage of clusters development	EOS	In your country, how widespread are well-developed and deep clusters (geographic concentrations of firms, suppliers, producers of related products and services, and specialized institutions in a particular field)? [1 = nonexistent; 7 = widespread in many fields]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Collaboration inside company	EOS	In your country, to what extent do people collaborate and share ideas within a company? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Collaboration between companies	EOS	In your country, to what extent do companies collaborate in sharing ideas and innovating? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

Title	Data type [†]	Indicator description	Sources	Most frequent occurrence
University- industry collaboration in R&D	EOS	In your country, to what extent do business and universities collaborate on research and development (R&D)? [1 = do not collaborate at all; 7 = collaborate extensively]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Encouragement of idea generation	EOS	In your country, to what extent do companies encourage employees to generate new ideas? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Exposure to new ideas	EOS	In your country, to what extent are people exposed to ideas from outside their environment/community? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
ICTs and business model creations	EOS	In your country, to what extent do ICTs enable new business models? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Companies embracing disruptive ideas	EOS	In your country, to what extent do companies embrace risky or disruptive business ideas? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Number of scientific and technical articles	Non-EOS	Number the scientific articles per 1,000 population. This takes into account scientific and engineering articles published in physics, biology, chemistry, mathematics, clinical medicine, biomedical research, engineering and technology, and earth and space sciences.	World Bank, World Development Indicators (WDI); and International Monetary Fund (IMF), World Economic Outlook, http:// data.worldbank.org/ and http://imf.org/weo	2013
Patent application	Non-EOS	Number of applications filed under the Patent Cooperation Treaty (PCT) per million population	Organization for Economic Co-operation and Development (OECD), patent database, situation as of July 2016); for population, International Monetary Fund (IMF), World Economic Outlook Database (April 2016 edition); World Economic Forum calculation	2012–2013 average
Company spending on R&D	EOS	In your country, to what extent do companies invest in research and development (R&D)? [1 = do not invest at all in R&D 7 = invest heavily in R&D]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Buyer sophistication	EOS	In your country, on what basis do buyers make purchasing decisions? [1 = based solely on the lowest price; 7 = based on sophisticated performance attributes]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
International brands	EOS	In your country, how successful are domestic companies at building international brands? [1 = not successful at all; 7 = extremely successful]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average
Trademark application	Non-EOS	Number of international trademark applications issued directly or through the Madrid System by country of origin per 1,000 population.	System by Organization (WIPO),	
Capacity to commercialize new products	EOS	In your country, to what extent do companies turn ideas into commercially successful new products, services, or business models? [1 = not at all; 7 = to a great extent]	World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this <i>Report</i> .	2015–2016 weighted average

 $^{^{\}dagger}$ EOS = Executive Opinion Survey; Non-EOS = other sources.

CHAPTER 1.3

The Executive Opinion Survey: The Voice of the **Business Community**

CIARA BROWNE ATTILIO DI BATTISTA THIERRY GEIGER STÉPHANIE VERIN World Economic Forum For almost 40 years, The Global Competitiveness Report has been used by policymakers, business executives, and academics as a tool that contributes a valuable portrait of an economy's productivity and its ability to achieve sustained levels of prosperity and growth. Central to the Report's index, the Executive Opinion Survey (the Survey) is the longest-running and most extensive survey of its kind, capturing the opinions of business leaders around the world on a broad range of topics for which statistics are unreliable, outdated, or nonexistent for many countries. Thus the Survey aims to measure critical concepts-such as appetite for entrepreneurship, the extent of the skills gap, and the incidence of corruption—to complement the traditional sources of statistics and provide a more accurate assessment of the business environment and, more broadly, of the many drivers of economic development.

The indicators derived from the Survey are used in the calculation of the Global Competitiveness Index (GCI) as well as a number of other World Economic Forum indexes, such as the Networked Readiness Index, the Enabling Trade Index, the Travel & Tourism Competitiveness Index, the Gender Gap Index, and the Human Capital Index as well as several other reports, including The Inclusive Economic Growth and Development Report and a number of regional competitiveness studies.

A truly unique source of data, the Survey has also long been used by a number of international and nongovernmental organizations, think tanks, and academia for empirical and policy work. For example, Transparency International has been using selected indicators from the Survey in its Corruption Perceptions Index. Institutions such as the Organisation for Economic Co-operation and Development (OECD), the World Bank, the Mo Ibrahim Foundation, and the International Monetary Fund (IMF) also refer to the Forum's Survey data in their publications, as do a number of academic publications. Furthermore, a number of countries publish national competitiveness studies and reports that draw on or refer to the Survey data. Finally, many privatesector companies also use the data for their studies.

THE SURVEY IN NUMBERS

The Executive Opinion Survey 2016 captured the opinions of 14,723 business executives in 141 economies between February and June 2016. Following the data editing process described below, 13,877 responses in 135 economies were retained (see Figure 1). The 2016 edition of the Survey was made available in 39 languages (see Table 1), 21 of which were available online. The share of participants who took the Survey online increased to 43 percent this year. In 31 economies the Survey was administered entirely online, and in a further 10 economies, over 90 percent of respondents participated online (see rightmost column of Table 2).

Covered in both 2015 and 2016 Covered in 2016 ☐ Not covered in 2016

Figure 2: Country/economy coverage of the Executive Opinion Survey

Geographic coverage

Some countries have been reinstated in the 2016 edition of the Survey after one or more years of exclusion. These are Barbados and Yemen (last included in 2014) and Brunei Darussalam (last included in 2013). For the first time ever, the Survey was administered in the Democratic Republic of Congo. However, it was not completed to minimum requirements in Haiti, Seychelles, and Suriname. For this reason, these economies are not included in this year's edition of the Report (Figure 2).

SURVEY STRUCTURE, ADMINISTRATION, AND **METHODOLOGY**

The Survey is divided into 15 sections:

- I. About Your Company
- II. Most Problematic Factors for Doing **Business**
- III. Infrastructure
- IV. Technology
- V. Financial Environment
- VI. Foreign Trade and Investment
- **Domestic Competition**
- VIII. Business Operations and Innovation
- IX. Security
- X. Governance
- XI. Education and Human Capital
- XII. Health
- XIII. **Travel and Tourism**
- XIV. **Environment**
- XV. Risks

Most questions in the Survey ask respondents to evaluate, on a scale of 1 to 7, one particular aspect of their operating environment. At one end of the scale, 1 represents the worst possible situation; at the other end of the scale, 7 represents the best (see Box 1 for an example).

The Survey is administered by the World Economic Forum and conducted at national level by the Forum's network of Partner Institutes. Partner Institutes are recognized research or academic institutes, business organizations, national competitiveness councils, or other established professional entities and, in some cases, survey consultancies. These institutes have the network to reach out to the business community, are reputable organizations, and have a firm commitment to improving the competitiveness conditions of their economies. (For the full list, see the Partner Institutes section at the beginning of this Report.)1

In administering the Survey and in order to gather the strongest dataset, Partner Institutes are asked to follow detailed sampling guidelines to ensure that the sample of respondents is the most representative possible and comparable across the globe and in a specific timeframe. The sampling guidelines are based on best practices in the field of survey administration and on discussions with survey experts. In view of comparability across countries and time, the sampling guidelines have remained the same since their revision and the improvements implemented in 2012. The Survey sampling guidelines specify that the Partner Institute build a "sample frame"—that is, a list of

Note: All statistics are computed following the editing of the data; see text for details. "n/a" indicates that this information is not provided for economies for which 2016 data are not available; "—" indicates that there was no online administration of the Survey.

* Weight applied to the country score in that edition of the Survey. See Box 3 for details.

† Share of surveys completed online (2016 only).

Box 1: Example of a typical Survey question

In your country, to what extent do ICTs enable new business models?

Not at all < 1 2 3 4 5 6 7 > To a great extent

- Circling 1... means you agree completely with the answer on the left-hand side
- Circling 2... means you largely agree with the lefthand side
- Circling 3... means you somewhat agree with the lefthand side
- Circling 4... means your opinion is indifferent between the two answers
- Circling 5... means you somewhat agree with the righthand side
- Circling 6... means you largely agree with the right-hand
- Circling 7... means you agree completely with the answer on the right-hand side

potential business executives from small- and mediumsized enterprises and large companies—from the various sectors of activity, as detailed below. It then applies a dual stratification procedure based on these two criteria of company size and sector. Specifically, the Partner Institutes are asked to carry out the following steps:

- 1. Prepare a "sample frame," or large list of potential respondents, which includes firms representing the main sectors of the economy (agriculture, manufacturing industry, non-manufacturing industry, and services).
- 2. Separate the frame into two lists: one that includes only large firms, and one that includes all other firms (both lists representing the various economic sectors).2
- 3. Based on these lists, and in view of reducing survey bias, choose a new selection of these firms from both lists to receive the Survey.

Furthermore, the sampling guidelines specify that the Partner Institute should aim to collect a combination of new respondents with some repeat respondents for further comparative analysis.3 Finally, the Partner Institutes are asked to collect Surveys from all regions of the economy, again to better represent the economy. The Survey is administered in a variety of formats, including face-to-face or telephone interviews with business executives, mailed paper forms, and online surveys. For environmental, time, and cost

considerations, the Forum encourages the use of the online survey tool.

The Partner Institutes also play an active and essential role in disseminating the findings of The Global Competitiveness Report and other reports published by the World Economic Forum by holding press events and workshops to highlight the results at the national level to the business community, the public sector, and other stakeholders.

Survey methodology reviews

With its aim of applying surveying best practices, the Survey as a tool is reviewed every year and its methodology has been audited by survey experts. The audits, undertaken by Gallup, took place in 2008 and 2012. In response to these audits, the Survey process has undergone a number of improvements both to the Survey tool itself as well as to the sampling guidelines, following international best practices in surveying.

Furthermore, an issue that comes up in discussions of international surveying, and that was also noted as part of the Survey's 2012 review, is that national culture—the so-called cultural bias—may impact interviewee responses. The Global Competitiveness and Risks Team recognizes this as a possibility; nonetheless, following international best practices and upon Gallup's recommendation, it was decided not to re-weight the data using vignettes because of the limited effectiveness of such a procedure and to prevent introducing additional noise into the data that can occur with such an approach. In order to mitigate cultural bias, the Partner Institutes are reminded to administer the Survey according to guidelines and to ask the respondents to answer the Survey in view of the country they are assessing based on international comparison.

With such ongoing efforts in the realm of survey administration best practice, the Forum's competitiveness team continues to improve processes to achieve greater data quality and heightened comparability across economies. Further details about the Survey's demographics are described in Box 2 on pages 84-85 and further statistics and weightings can be seen in Table 2 on pages 80-81.

DATA TREATMENT AND SCORE COMPUTATION

This section details the process whereby individual responses are edited and aggregated in order to produce the scores of each economy on each individual question of the Survey. These results, together with other indicators obtained from other sources, feed into the GCI and other research projects.4

Data editing

Prior to aggregation, the respondent-level data are subjected to a careful editing process. A first series of tests is run to identify and exclude those surveys whose patterns of answers demonstrate a lack of sufficient

focus on the part of the respondents. Surveys with at least 80 percent of the same answers are excluded. Surveys with a completion rate inferior to 50 percent are excluded.⁵ The very few cases of duplicate surveys which can occur, for example, when a completed survey is both completed online and mailed in-are also excluded in this phase.

In a second step, a multivariate test is applied to the data using the Mahalanobis distance method. This test estimates the probability that an individual survey in a specific country "belongs" to the sample of that country by comparing the pattern of answers of that survey against the average pattern of answers in the country sample.

More specifically, the Mahalonobis distance test estimates the likelihood that one particular point of N dimensions belongs to a set of such points. One single survey made up of N answers can be viewed as the point of N dimensions, while a particular country sample c is the set of points. The Mahalanobis distance is used to compute the probability that any individual survey i does not belong to the sample c. If the probability is high enough—we use 99.9 percent as the threshold we conclude that the survey is a clear outlier and does not "belong" to the sample. The implementation of this test requires that the number of responses in a country be greater than the number of answers, N, used in the test. The test uses 52 core questions, selected by their relevance and placement in the survey instrument.

A univariate outlier test is then applied at the country level for each question of each survey. We use the standardized score—or "z-score"—method, which indicates by how many standard deviations any one individual answer deviates from the mean of the country sample. Individual answers with a standardized score $z_{i,a,c}$ greater than 3 are dropped.

Aggregation and computation of country averages

We use a simple average to compute scores of all countries.⁶ Therefore, every individual response carries the same implicit weight.

Formally, the country average of a Survey indicator i for country c, denoted $q_{i,c}$, is computed as follows:

$$q_{i,c} = \frac{\sum_{j}^{N_{i,c}} q_{i,c,j}}{N_{i,c}}$$

where

 $q_{i,c,j}$ is the answer to question i in country c from respondent j; and

 $N_{i,c}$ is the number of respondents to question i in country c.

Moving average and computation of country scores

As a final step, the country averages for 2016 are combined with the 2015 averages to produce the country scores that are used for the computation of the GCI 2016-2017 and for other projects.

The moving average technique, introduced in 2007, consists of taking a weighted average of the most recent year's Survey results together with a discounted average of the previous year. There are several reasons for doing this. First, it makes results less sensitive to the specific point in time when the Survey is administered. Second, it increases the amount of available information by providing a larger sample size. Additionally, because the Survey is carried out during the first quarter of the year, the average of the responses in the first quarter of 2015 and first quarter of 2016 better aligns the Survey data with many of the data indicators from sources other than the Survey, which are often year-average data.

To calculate the moving average, we use a weighting scheme composed of two overlapping elements. On one hand, we want to give each response an equal weight and, therefore, place more weight on the year with the larger sample size. At the same time, we would like to give more weight to the most recent responses because they contain more updated information. That is, we also "discount the past." Table 2 reports the exact weights used in the computation of the scores of each country, while Box 3 details the methodology and provides a clarifying example.

Trend analysis and exceptions

The two tests described above address variability issues among individual responses in a country. Yet they were not designed to track the evolution of country scores across time. We therefore carry out an analysis to assess the reliability and consistency of the Survey data over time. As part of this analysis, we run an inter-quartile range test, or IQR test, to identify large swings—positive and negative—in the country scores. More specifically, for each country we compute the year-on-year difference, d, in the average score of a core set of 66 Survey questions. We then compute the inter-quartile range (i.e., the difference between the 25th percentile and the 75th percentile), denoted IQR, of the sample of 138 economies. Any value d lying outside the range bounded by the 25th percentile minus 1.5 times IQR and the 75th percentile plus 1.5 times IQR is identified as a potential outlier. Formally, we have:

$$\begin{cases} lower bound = Q1 - 1.5 \times IQR \\ upper bound = Q3 + 1.5 \times IQR \end{cases}$$

where

Q1 and Q3 correspond to the 25th and 75th percentiles of the sample, respectively, and IQR is the difference between these two values.

Box 2: Insights from the Executive Opinion Survey 2016

The sampling guidelines for the Executive Opinion Survey aim to reflect in the composition of surveyed companies the economic structure of the country while maintaining a 50 percent share of respondents from previous years. Figure 1 summarizes respondent demographics from the 2016 edition of the survey, thus demonstrating the efforts undertaken by the Partner Institutes to follow the sampling guidelines.

Because small- and medium-sized enterprises (SMEs) account for a large share of economic activities in most countries, the Partner Institutes are asked to collect the

opinions from SMEs as well as from large companies (Figure 1a). In 2016, small enterprises, defined here as those with fewer than 50 employees, account for a share of respondents ranging from 18 percent in North America to 49 percent in Sub-Saharan Africa. On average, one respondent out of three has already taken part in the survey in the past. This allows maintaining a panel of constant respondents within the sample and increases the comparability of data across years (Figure 1b).

Figure 1: Executive Opinion Survey: Respondent profile by region

Note: Figures in parentheses represent the number of respondents in that region. See page xiii for group composition.

Being one of the most comprehensive, regular, and largescale exercises of its kind, the Executive Opinion Survey allows us to monitor across time which areas businesses see as particularly problematic for the economic competitiveness of their countries. It is therefore an invaluable source that can inform public-private dialogue at the national and regional levels and help policymakers in prioritizing their efforts.

Figure 2 looks at the 2016 Executive Opinion Survey results in a new, innovative way. Focusing exclusively on the questions that feed into the Global Competitiveness Index, the answers of each respondent have been normalized as the distance (in percentage terms) from the respondent-specific average. These distances have then been re-aggregated through simple averages to form areas of analysis that, to the extent possible, mirror the components and subcomponents of the Global Competitiveness Index. Areas with a negative distance are the ones that, on average, respondents in the region have assessed as relatively more problematic. Importantly, given this normalization, results do not indicate the level of development of each element in the region. For example, a score of -18 percent for the efficiency of the financial market in Europe should not be compared with a score of -17 percent in sub-Saharan Africa to conclude that

the level of efficiency in the two regions is similar. Rather these two negative scores indicate that business executives in both regions prioritize this element in a similar way in terms of how problematic it is with respect to the other drivers of competitiveness.

In the East Asia and Pacific region, businesses have given lower scores especially to the performance of the public sector and to the incidence of undue influence in their countries. With few exceptions, such as New Zealand, this holds true across most countries in the region, including advanced economies. The same areas are also problematic in Europe, according to the executives there, who have also expressed a negative assessment of the efficiency of their financial market. In that region, public institutions receive low scores in many Central and Eastern European countries, while financial market efficiency attracts most of the private sector's discontent in the western half of the continent, particularly in the southern economies. This is also true in Eurasia, where falling oil prices have hit particularly hard and have put the financial sector under stress. Private companies in Eurasia also complain about the quality of public institutions, with undue influence being the factor with the second-lowest average score. Low fuel prices have also put a strain on

(Cont'd.)

Box 2: Insights from the Executive Opinion Survey 2015 (cont'd.)

the efficiency of financial markets in the Middle East and North Africa, where the use of human talent is also deemed particularly inefficient. As for Latin America and the Caribbean, executives seem to believe that most countries in the region remain plagued by high levels of corruption, undue influence on the government and other public institutions, and poor performance of the public sector. Latin America is also the region where results are most skewed, with the distance from the average score ranging from -27 percent (ethics and corruption) to +36 percent (trustworthiness and confidence in the financial sector). Public institutions collect low scores also in North America, although with a much smaller distance from the average (-11 percent on undue influence), while financial markets seem to have recovered well in the continent and their assessment is generally in line with that of other competitiveness factors. Ethics and corruption and undue influence are the areas that receive the lowest appraisal by businesses in South Asia, followed by infrastructure.

This finding shows how the region, one of the poorest in the world, still needs to work on the basic foundations of competitiveness to allow its private sector to thrive. Sub-Saharan Africa economies appear to face many of the same challenges, although in this case the infrastructure gap appears even wider than it is in South Asia. The inefficiency of the financial market also attracts a lot of the discontent of businesses in the region, receiving an average score that is 17 percent lower than that of all competitiveness factors.

In terms of general trends, businesses across all regions appear generally optimistic about the capacity of their countries to adopt existing technologies, but, with the relevant exception of North America, all of them are almost equally negative about the quality of their innovation environment. Almost a decade after the outbreak of the global economic crisis, the efficiency of the financial markets is still a source of discontent across all regions, with a negative delta ranging from -22 percent for Eurasia to -4 percent in North America.

Box 3: Country/economy score calculation

This box presents the methodology applied to compute the country scores for the vast majority of economies included in The Global Competitiveness Report 2016-2017 (see text for exceptions).

For any given Survey question *i*, country *c*'s final score, $q_{ic}^{2015-16}$, is given by:

$$q_{ic}^{2015-16} = w_c^{2015} \times q_{ic}^{2015} + w_c^{2016} \times q_{ic}^{2016}$$
 (1)

where

 q_{ic}^t is country c's score on question i in year t, with t = 2015, 2016, as computed following the approach described in the text; and

 w_c^t is the weight applied to country c's score in year t (see below).

The weights for each year are determined as follows:

$$w_c^{2015} = \frac{(1-\alpha) + \frac{N_c^{2015}}{N_c^{2015} + N_c^{2016}}}{2} \qquad (2a) \qquad \text{and} \qquad w_c^{2016} = \frac{\alpha + \frac{N_c^{2016}}{N_c^{2015} + N_c^{2016}}}{2} \qquad (2b)$$

where N_c^t is the sample size (i.e., the number of respondents) for country c in year t, with t = 2015, 2016. α is a discount factor. Its value is set at 0.6. That is, the 2015 score of country c is given 2/3 of the weight given to the 2016 score.

Plugging Equations (2a) and (2b) into (1) and rearranging yields:

$$q_{lc}^{2015-16} = \frac{1}{2} \times \left[\underbrace{(1-\alpha) \times q_{lc}^{2015} + \alpha \times q_{lc}^{2016}}_{\text{discounted-past weighted average}} \right] + \frac{1}{2} \times \left[\underbrace{\frac{N_c^{2015}}{N_c^{2015} + N_c^{2016}} \times q_{lc}^{2015} + \frac{N_c^{2016}}{N_c^{2015} + N_c^{2016}} \times q_{lc}^{2016}}_{\text{cample size weighted average}} \right]$$
(3)

In Equation (3), the first component of the weighting scheme is the discounted-past weighted average. The second component is the sample-size weighted average. The two components are given half-weight each. One additional characteristic of this approach is that it prevents a country sample that is much larger in one year from overwhelming the smaller sample from the

The formula is easily generalized. For any two consecutive editions t_1 and t_2 of the Survey, country c's final score on question i is computed as follows:

$$q_{lc}^{t_{i}-t_{b}} = \frac{1}{2} \times \left[(1-\alpha) \times q_{lc}^{t_{i}} + \alpha \times q_{lc}^{t_{b}} \right] + \frac{1}{2} \times \left[\frac{N_{c}^{t_{i}}}{N_{c}^{t_{i}} + N_{c}^{t_{b}}} \times q_{lc}^{t_{i}} + \frac{N_{c}^{t_{b}}}{N_{c}^{t_{i}} + N_{c}^{t_{b}}} \times q_{lc}^{t_{b}} \right]$$
(4)

(Cont'd.)

This test allows for the identification of potentially problematic countries, which display large upward or downward swings or repeated and significant changes over several editions. The IQR test is complemented by a series of additional empirical tests, including an analysis of five-year trends and a comparison of changes in the Survey results with changes in other indicators capturing similar concepts. We also conduct interviews of local experts and consider the latest developments in a country in order to assess the plausibility of the Survey results.

Based on the result of this test and additional qualitative analysis, and in light of the developments in these respective countries, it was decided to not use the data collected in Egypt, Hong Kong SAR, and Nicaragua. In those cases, we use the results from last year, which were derived from the results of the 2014

and 2015 editions (see the Exceptions section in Box 3 for a formal description).

CONCLUSION

The Executive Opinion Survey has become one of the largest executive studies of its kind, collecting the perceptions of over 14,000 business executives in 138 economies. As with all perception data, it is essential to apply a detailed sampling methodology in view of collecting the most representative sample of the country's economic structure as well as minimizing the risk of cultural bias. As described above and to this effect, the Forum works closely with its network of over 160 Partner Institutes to carry out the Survey at a national level. Therefore, along with the dataediting measures, the strong collaboration with the Partner Institutes and their commitment to following the guidelines is essential. Together these allow us to deliver

Box 3: Country/economy score calculation (cont'd.)

Exceptions

As noted in the text, there are a number of exceptions to the approach described above. In illustrating them below, we use actual years—rather than letters—in equations for the sake of concreteness.

In the case of Survey questions that were introduced in 2016, where, by definition, no past data exist, the weight applied to the 2015 score is $w_c^{2015} = 0$ and the weight applied to the 2016 score is $w_c^{2016} = 1$. Equation (1) simply is $q_c^{2015-16} = q_{ic}^{2015}$. The same is true for the Democratic Republic of Congo. In this case, we have $q_{ic}^{2015-16} = q_{ic}^{2016}$.

In the case of countries for which the 2016 data were discarded, we rely on the results from last year's edition as a proxy. They were calculated using Equation (1), but instead of using the 2015 and 2016 editions of the Survey, they were derived from the 2014 and 2015 editions, respectively. Therefore, we have $q_{ic}^{2014,2015} = w_c^{2014} \times q_{ic}^{2014} + w_c^{2015} \times q_{ic}^{2015}$

Finally, in the case of countries whose data failed the inter-year robustness check last year and for which the 2015 data were discarded, we use the Survey data from 2014 instead, and combine them with those of 2016 to compute the scores. Equation (1) then becomes: $q_{ic}^{2014,2016} = w_c^{2014} \times q_{ic}^{2014} + w_c^{2016} \times q_{ic}^{2016}$. The same treatment applies for those countries where the Survey was not administered in 2015 but was conducted in 2014 and in 2016. This is the case for Barbados and Yemen.

Example of score computation

For this example, we compute the score of Paraguay for the indicator Burden of government regulation, which is included in the Global Competitiveness Index (indicator 1.09) and derived from the following Survey question: "In your country, how burdensome is it for companies to comply with public administration's requirements (e.g., permits, regulations, reporting)? [1 = extremely burdensome; 7 = not burdensome at all] | 2015-16 weighted average." This question is not a new Survey question and Paraguay did not fail the inter-year robustness test either this year or last year. Therefore the normal treatment applies, using Equation (1). Paraguay's Survey score was 3.61 in 2015 and 3.33 in 2016. The weighting scheme described above indicates how the two scores are combined. In Paraguay, the size of the sample was 73 in 2015 and 79 in 2016. Using $\alpha = 0.6$ and applying Equations (2a) and (2b) yields weights of 44.0 percent for 2015 and 56.0 percent for 2016 (see Table 2). The final country score for this question is therefore:

$$\underbrace{0.440 \times 3.61}_{2015} + \underbrace{0.560 \times 3.33}_{2016} = 3.45.$$

This is the final score used in the computation of the GCI. Although numbers are rounded to two decimal places in this example and to one decimal place in the Paraguay country profile, exact figures are used in all calculations.

this unique and global dataset, which feeds into The Global Competitiveness Report 2016-2017 and is used by many organizations, governments, and businesses around the world.

NOTES

- 1 The World Economic Forum's Competitiveness and Risks Team would like to acknowledge Research Now for carrying out the Executive Opinion Survey 2016 in the United States, following the detailed sampling guidelines. Furthermore, Research Now supplemented a sample in Germany.
- 2 Company size is defined as the number of employees of the firm in the country of the Survey respondent. The company size value used for delineating the large and small company sample frames varies across countries. The size value tracks closely with the overall size of the economy. Adjustments were made to the value based on searches in company directories and data gathered through the administration of the Survey in past years.
- In order to reach the required number of surveys in each country (80 for most economies and 300 for the BRICS countries and the United States), a Partner Institute uses the response rate from previous years.
- 4 The results are the scores obtained by each economy in the various questions of the Survey. The two terms are used interchangeably throughout the text.

- 5 The completion rate is the proportion of answered questions among a subset of questions in the Survey instrument. These 130 core questions are all numerical questions of sections III through
- 6 Until 2013, we used a sector-weighted average for computing country scores. Since 2014, we have used a simple average. Refer to Chapter 1.3 of The Global Competitiveness Report 2014–2015 for a detailed discussion about this evolution of the methodology.

Browne, C., A. Di Battista, T. Geiger, and T. Gutknecht. 2014. "The Executive Opinion Survey: The Voice of the Business Community." The Global Competitiveness Report 2014-2015. Geneva: World Economic Forum, 85-96.

Part 2 Country/Economy Profiles

How to Read the Country/Economy Profiles

The Country/Economy Profiles section presents a twopage profile for each of the 138 economies covered in The Global Competitiveness Report 2016–2017.

PAGE 1

• Key indicators

The first section presents a selection of key indicators for the economy under review. All data in this section are for 2015 and sourced from the April 2016 edition of the International Monetary Fund (IMF)'s World Economic Outlook (WEO) Database.

2 Performance overview

This section details the economy's performance on the main components of the Global Competitiveness Index (GCI). The table on the upper left of this section shows the evolution in the economy's overall GCI rank and score since the 2012-2013 edition (or the earliest edition available). On the right-hand side, a chart shows the economy's performance in the 12 pillars of the GCI (blue line) measured against the region's average scores. See page xiii for group composition. For selected economies, a brief commentary of the performance appears at the bottom part of this section.

The most problematic factors for doing business

This chart summarizes those factors seen by business executives as the most problematic for doing business in their economy. The information is drawn from the World Economic Forum's Executive Opinion Survey (the Survey). From a list of 16 factors, respondents were asked to select the five most problematic and rank them from 1 (most problematic) to 5. The results were then tabulated and weighted according to the ranking assigned by respondents.

PAGE 2

4 The Global Competitiveness Index in detail

This page details the country's performance on each of the indicators entering the composition of the GCI. Indicators are organized by pillar. For indicators entering the GCI in two different pillars, only the first instance is

shown on this page. See Appendix A of Chapter 1.1 for the detailed structure of the GCI and methodology.

Indicators derived from the Survey are always expressed as scores on a 1-7 scale, with 7 being the most desirable outcome. For those, units are omitted for the sake of readability. For indicators that are not derived from the Survey, the units are displayed next to the indicator name. A line depicts the evolution of this value since the 2012-2013 edition of the Report (or the earliest period available).

Argentina gains two positions to 104th, driven mainly by innovation and sophistication factors, reflecting better preparedness to cope with a changing future environment. The quality of institutions improved mainly through better intellectual property protection and a more efficient legal framework. The quality of education and use of talent show signs of progress, as does the efficiency of goods markets. Argentina's improvement in both ranking and score comes while a new administration implements

broad reforms in an adverse external context: the recession in Brazil, Argentina's main trading partner; low commodity prices; adjustments in utility tariffs; and high inflation have all made the transition toward a more market-oriented model difficult. Consumer sentiment remains weak but growth is expected to rebound, supported by competitiveness-improving reforms.

Most problematic factors for doing business

12th pillar: Innovation	26	4.5				Διισ	stralia E	East Asia an	d Pacific	

Australia's (22nd) performance is stable compared with the previous edition and remarkably consistent yet never stellar-Australia does not rank lower than 28th across the 12 pillars, and it ranks in the top 10 of three pillars. Notable strengths include access to education and the quality of its education system. Australia places 10th in the health and primary education pillar and 9th in higher education and training. Improving further, Australia now ranks 6th overall in the financial development pillar, thanks to the high level of trust and confidence in the system. The efficiency of the labor market, where Australia used to rank in the 50s, improves further (28th, up

eight)—a gain of almost 30 places over the past three years. Despite the prolonged commodity bust, Australia's performance in the macroeconomic situation (23rd, up five) is strong, with the government reducing the fiscal deficit to less than 3 percent. Innovation represents Australia's challenge and imperative in the face of low commodity prices and China's slowdown. In both business sophistication (28th, down one) and innovation (26th, down three), Australia not only lags far behind the best performers but also loses ground to them.

Most problematic factors for doing business

* 12th pillar: Innovation	100	3.1	_			■ Brazil	Latin An	acrica and t	he Caribbean		

In the context of negative terms of trade shocks and political turmoil, Brazil falls six positions to 81st. This is driven mainly by deteriorating goods, labor, and financial markets. On the institutional side, security has deteriorated and also the perception of the quality of public-sector administration. However, Brazil has improved in areas such as protection of property rights and measures of undue influence, and the country's bounce back after a sharp drop last year probably reflects the fight against corruption and for judicial independence. The political uncertainty and the government's sinking finances are still impediments to consolidating a pro-growth competitiveness agenda in the largest economy in Latin America and the

Caribbean. Brazil is currently going through a recession. The country's growth rate has decelerated steadily, from an average annual growth rate of 4.5 percent between 2006 and 2010 to 2.1 percent between 2011 and 2014, according to the World Bank, and negative growth projected for 2015 and 2016. Addressing the macroeconomic imbalances facing the country, including large current account and government deficits and increasing inflation, requires improving productivity, starting with the macroeconomic environment and addressing the market distortions affecting how markets

Cambodia ranks 89th, up one position from last year. Among Asian nations, it is the one that has posted the largest GCI score improvement—from 3.5 to 4.0-since 2007. Despite the positive trend, the challenges are many and significant. Cambodia ranks no better than 50th in any of the 12 pillars of the Index; in half of them it sits beyond the 100th mark. Of particular concern is its mediocre performance in three of the four areas that constitute the basic drivers of competitiveness: institutions (104th, up seven), infrastructure

(106th, down five), and health and primary education (103rd, down 16). Moreover, Cambodia ranks 124th in higher education and training, its poorest performance in any pillar. It is estimated that secondary education enrollment is around 50 percent. With a median age of 23.8, Cambodia is home to one of the youngest populations in Asia. Ensuring access to quality of education for all should therefore be a policy priority.

China retains its 28th rank for the third year in row. Its overall score improves, thanks to progress in some of the more sophisticated areas of competitiveness that contribute to shaping the country's innovation ecosystem. These include higher education (54th, up 14), innovation (30th, up one), and business sophistication (34th, up four). This bodes well for the future while China transitions to a new normal, where growth will need to be increasingly driven by innovation. Yet China still lags behind in technological readiness (74th, unchanged) despite a significant improvement in all components of this category since last year. A more widespread adoption of technology by business and the population at large will increase productivity and create a more fertile innovation ecosystem. The gains posted in these

categories are partially offset by a worsening fiscal situation—the budget deficit more than doubled between 2014 and 2015, to reach 2.7 percent of GDP-but China still ranks a strong 8th in the macroeconomic pillar. In addition, little progress has been made over the past year in two areas that are critical for accelerating the transition to a new growth model. First, goods market efficiency (56th, up two) is undermined by various distortions, including the lack of competition caused by high barriers to entry for foreign firms (113th) and new businesses—it takes over a month to start up a business. Second, inefficiencies and instability characterize the financial sector (56th, down two)—the result of inefficiencies, non-performing loans, lack of competition, and suboptimal allocation of capital.

Egypt remains stable at 115th position this year. To create growth and employment, Egypt could build on its large market size (25th); its business sector, which by some accounts appears more sophisticated than those of neighboring countries (85th); and its geographical proximity to the large European market. To do so, Egypt needs to step up its reform efforts and address the major rigidities that plague its goods, labor, and financial markets, on which the country ranks 112th, 135th, and 111th, respectively. Other priorities include higher education and training (112th), which is below the performance of peer economies, particularly in terms of quality (134th); as well as the overall security situation (133rd), which remains fragile and imposes significant cost for business. Support for reform efforts comes from the recent drop in oil prices that could open up the fiscal space to consolidate the public budget by reducing energy subsidies, which make up a significant part of the public spending.

Finland drops two places to 10th, mainly as a result of its weakening macroeconomic environment. The country has been hit hard by the global economic downturn-especially the fall of exports to Russia and the drop in demand for paper and electronic exports—which has hurt Finland's competitiveness for the past three years. Although some improvements are perceived in the labor market (up three places to 23rd), with an improvement in the efficient use of talent (up one to 6th), these are offset by the market's

rigidity (102nd): restrictive labor regulation is identified as the most problematic factor for doing business. The government's planned reforms in this area are to be commended. Finland can count on its first-class, efficient, and transparent institutions and its high-quality education system. Finland is also well positioned in terms of innovation, with its capacity to innovate supported by the excellent availability of scientists and engineers (1st) and a high degree of collaboration between universities and industry (2nd).

Most problematic factors for doing business

France remains stable this year (moving up one spot to 21). Its largest improvement is in the innovation and sophistication subindex (15th, up five), although the underlying score improvements are small. The macroeconomic environment (67th) is improving but still weak: although the budget deficit has been reduced, government debt is approaching 100 percent of GDP and inflation is near zero. Relatively low levels of efficiency of both the goods and labor markets have traditionally weighed down competitiveness in France. In a move that should ultimately boost competitiveness, the

French government pushed through wide-ranging labor market reforms in July 2016 against considerable opposition. Going forward, France will need to ensure that its talent base does not erode: the GCI data suggest that France's capacity to attract and retain talent has deteriorated since last year (51st, down 9, and 86th, down 23, respectively); this includes the availability of scientist and engineers, although the talent pool is still relatively large in this case (26th overall).

Despite a slight improvement in its overall score, Germany drops one place to 5th. Its macroeconomic environment is generally stable, with a very low government deficit, yet—like the rest of the euro zone—it faces near-zero inflation. The country continues to push the innovation frontier, ranking high on the pillars of technological readiness (10th), innovation (5th), and business sophistication (3rd). Germany does well in efficiently using its talent (14th), supported by management practices that encourage worker involvement. As recent empirical evidence suggests, this type of decentralized management is effective in incentivizing quality upgrades and

other types of product improvements, which in turn boost export competitiveness. An important labor market challenge for the coming year will be the integration of the large numbers of migrants, many of whom arrived over the course of 2015; first steps have been taken to lower labor market entry barriers for asylum seekers. An improvement from 82nd to 65th is registered in an important business environment indicator, as the number of days to start a business is reduced from 14.5 to 10.5. Yet the data show a longer-term deterioration in another dimension of the business environment with a drop to 58th on the security indicators.

Most problematic factors for doing business

Ranked for the fifth consecutive year in the top 10, Hong Kong SAR (9th, down two) achieves a strong and consistent performance: it ranks no lower than 33rd in any of the pillars and features in the top 10 pillars of seven of them. It tops the infrastructure pillar for the seventh time, reflecting the outstanding quality of its facilities across all modes of transportation. Its financial sector (4th) is very well developed, highly sophisticated, trustworthy, and stable. Hong Kong's domestic market is highly competitive, efficient, and one of the most open in the world. Its labor market is among the world's most flexible and efficient (3rd worldwide). Finally, Hong Kong is

hyper-connected and it boasts some of the highest rates of Internet use and mobile telephony penetration. Its business community is also highly sophisticated (17th). The challenge for Hong Kong is to evolve from one of the world's foremost financial hubs to become an innovative powerhouse: with the exception of the market size pillar (33rd), innovation remains the weakest aspect (27th) of Hong Kong's performance and the business community consistently cites the capacity to innovate as their biggest concern.

Most problematic factors for doing business

India climbs for the second year in a row, to 39th. Its 16-place improvement is the largest this year. India's competitiveness has improved across the board, in particular in goods market efficiency, business sophistication, and innovation. Thanks to improved monetary and fiscal policies, as well as lower oil prices, the Indian economy has stabilized and now boasts the highest growth among G20 countries. Recent reform efforts have concentrated on improving public institutions (up 16), opening the economy to foreign investors and international trade (up four), and increasing transparency in the financial system (up 15). Still, a lot needs to be done. The labor market is segmented between workers protected by rigid regulations and centralized wage determination (112th), especially in the manufacturing sector, and millions of unprotected and informal workers. The efficiency of the domestic market (81st) is hindered by fiscal regulations that allow federal states to levy different levels of value-added taxes; large, publicly owned enterprises further reduce the overall efficiency of the economy, especially in the utilities sector and the financial market, where there is growing concern about the incidence of non-performing loans. Finally, lack of infrastructure (68th) and ICT use (120th) remain bottlenecks. Improvement has been slow in recent years and further investment will be necessary, especially to connect rural areas and make sure they can equally benefit from and contribute to the country's development. See Box 6 of Chapter 1.1 of the Global Competitiveness Report 2016-2017 for an analysis of India's performance over the past decade.

Indonesia (41st) drops four places as it is overtaken by a few countries. Despite many reforms to its business environment, its performance remains one of contrasts: the country ranks 10th for market size, 30th in the macroeconomic environment pillar-in spite of the protracted commodity bust-and 31st for innovation. It performs well in terms of financial development (42nd, up seven). But Indonesia ranks a low 100th in the health and basic education pillar (down 20),36 and 108th in the labor market

efficiency pillar (up seven) as a result of various rigidities, prohibitive redundancy costs that amount to over a year's worth of salary (133rd), and the low labor force participation rate of women (115th). Indonesia also ranks a low 91st in the technological readiness pillar (down six) because ICT penetration remains low—only one fifth of the population uses the Internet and there is just one broadband connection for every 100 people. However, technology uptake by firms is more widespread (53rd).

Italy's competitiveness score has improved but more slowly than others', and it slips one spot to 44th. Its financial and labor markets and institutions continue to be its weakest areas, with rankings below 100th. Reforms implemented in recent years have improved businesses' perception of ethics and corruption (up 14), but public-sector performance remains poor, with pervasive red tape and a highly inefficient judicial system. Italy's labor market has become more efficient (up 17 since 2014): hiring and firing practices have been made more flexible and a framework was provided for more decentralized wage determination, but the full benefits of these reforms will require time and more cooperative labor-employer relations. In the meantime, Italy continues to squander its talent: in the south of the country, only one in three women work (according to the Italian Institute of Statistics (ISTAT), women's employment rate in southern Italy was 30.6

percent in 2015), while reforms to the pension system introduced in 2012, albeit necessary, have further closed the job market to youth. Financial market development (122nd) is Italy's weakest link: thebanking sector is burdened by non-performing loans, and some institutions need recapitalization. Recent scandals in mutual banks have further undermined trust, while governance issues—including the strong link with local banking foundations—have been only partially addressed. Italy has strengthened its macroeconomic position, but public debt remains high in light of low inflation. Innovation and business sophistication remain among the strengths of the Italian economy and Italy continues to improve important dimensions of its digital readiness as seen in the World Economic Forum's Global Information Technology Report 2016.

Japan (8th) loses two places, overtaken by Sweden and the United Kingdom. The macroeconomic situation (104th) continues to undermine Japan's competitiveness performance, although the situation has improved over the past year (up 17 places) thanks to a lower, yet still very large, budget deficit. Inflation is now again very close to zero and the 2 percent target set by the Bank of Japan has been met only once since Shinzo Abe became Prime Minister. Japan is also beset by the rigidities and lack of dynamism of its labor market (19th). Despite progressing eight places, Japan still ranks a low 115th on the ease of hiring and firing. The ratio of women to men in the labor force (77th) is one of the lowest among highincome economies. And Japan remains a rather unattractive destination for foreign talent (77th). The domestic market is relatively uncompetitive and closed, with high barriers to entry and to business creation. On the brighter side, Japan features in the top 10 of five pillars. It notably boasts an excellent infrastructure (5th) and firms are highly sophisticated (2nd), typically employing unique products and production processes (2nd) with significant control over international distribution (5th). High-quality research institutions (13th) and company spending on R&D (4th), coupled with an excellent availability of scientists and engineers (3rd), contribute to the country's overall highly innovative environment (5th). Yet Japan's innovation prowess seems to be eroding: consistently ranked in the top 5 between 2007 and 2015, Japan loses three positions and now ranks 8th.

Jordan retains its position at 63rd place despite the daunting challenges it has to face as a result of the geopolitical situation in the region. Jordan has the advantage of having a fairly efficient goods market (43rd) because of a certain intensity of domestic competition that raises the efficiency of firms. The country also has relatively efficient financial markets (33rd), although trustworthiness and confidence in the financial sector needs to be strengthened (107th) and the labor market has some flexibility (29th). Going forward, Jordan can take advantage of its fairly vibrant business sector (36th) and healthy level of adoption of technologies from abroad (40th) to achieve a higher, more sustainable growth path. Addressing macroeconomic challenges will be key to freeing up public funding for competitivenessenhancing investment, in particular in education (91st on primary education and 64th on enrollment in secondary and tertiary levels).

The Republic of Korea places 26th for the third consecutive year. This stable overall position conceals some notable improvement in a number of pillars. Building on healthy public finances, the country improves two places to a remarkable 3rd rank (behind Norway and Qatar) in the macroeconomic environment pillar. Korea also makes strides in the institutions pillar (63rd, up six), owing to improved public-sector performance (77th, up seven), security situation (55th, up 19), and corporate accountability (60th, up 15). Korea also post gains in infrastructure, entering the top 10 of this pillar for the first time. In the labor market efficiency pillar, one of the areas where it has struggled the most historically, Korea is improving, but from a low base

(77th, up six), suffering from rigidities (119th): it notably ranks 113th for the ease of firing and hiring workers, 112th for the average cost of redundancy, and 135th for the quality of social dialogue. After several years of decline, the country improves markedly in the financial development pillar (80th, up seven), posting gains in all indicators within the pillar except one. Although credit access conditions and low confidence in the banking system remain of concern, this encouraging development suggests that the financial reforms initiated by the government are starting to bear fruit. Finally, the quality of Korea's innovation remains excellent although it has eroded over the past year (20th, down one).

Most problematic factors for doing business

Mexico improves six positions to 51st place, mainly driven by gains in market efficiency. Domestic and foreign competition in the goods market all improve significantly, reflecting the results of competition and trade policy reforms. Labor markets have boosted flexibility and incentives, and financial markets have improved affordability. Primary education continues to be a significant competitiveness weakness compared to regional and global

leaders, and institutional quality is lagging. The Mexican economy has been hit by falling oil prices, weak global trade, and a resulting fall in industrial production. However, it is still one of the most competitive economies in the region, and is making progress on some of the fundamental drivers of future prosperity.

The Netherlands continues its climb toward the top of the Index, improving its score and rising by one spot to 4th. This is the result of small improvements across all three subindexes, with a solid and even performance across the pillars including top 10 ranks for infrastructure, health and primary education, higher education and training, goods market efficiency, technological readiness, business sophistication, and innovation. The Netherlands scores especially high on the quality of its scientific research institutions (4th) and closeness of links between universities and the private sector (5th). Success stories of social innovation are particularly

frequent in the Netherlands. One weakness is its 37th rank in financial market development, as both the perceived efficiency of and confidence and trust in the financial sector are low. On a continued upward trend, the country registers large positive moves again this year for labor market efficiency indicators, including for ease of hiring and firing; this comes in the wake of the entry into effect of the Work and Security Act in mid-2015. Importantly, the Act attempts to improve the position of flexible workers and simplifies dismissal procedures.

* 12th pillar: Innovation	113	2.9					Nigeria 🗌	Sub-Sahara	n Africa		

Nigeria is among the African economies hardest hit by the reduction in commodity prices, falling three places to 127th overall almost entirely due to its weaker macroeconomic environment (down 27 places) and financial sector (down 10 places). Although still relatively low, the government deficit has almost doubled since last year and national savings has significantly suffered, worsening the current account position. Banks are less solid, reducing the availability of credit; despite the central bank ending its currency peg, financial authorities have retained restrictions on access to

the interbank market, meaning access to finance will remain difficult for many businesses. Additional factors holding back Nigeria's competitiveness include an underdeveloped infrastructure (132nd), which is again rated as the country's most problematic factor for doing business; insufficient health and primary education (138th), with only 63 percent of children enrolled in primary school; and the poor quality and quantity of higher education and training (125th).

Most problematic factors for doing business

Nigeria

The Russian Federation fell into recession in 2015, with its GDP shrinking by 3.7 percent, but nonetheless remained rather stable in terms of its competitiveness (up two places at 43rd). This is partly the result of strengthened fundamentals, including the quality and quantity of education (up six places) and innovation capacity (up 12, although from a low base), along with an improved domestic business environment, and less negative domestic business sentiment than expected. Low commodities prices are affecting the Russian Federation somewhat less than other Eurasian economies: the level of government debt remains relatively low and gross national savings are almost unchanged. According to the IMF, economic

measures such as exchange rate flexibility, banking sector capital and liquidity injections, limited fiscal stimulus, and regulatory forbearance "cushioned the shocks, and helped restore confidence and stabilized the financial system." Nonetheless, the commodity price shock is still having a profound impact on the Russian economy: with sharply reduced public revenue and higher inflation, the Russian macroeconomic environment is much less sound, dropping to 91st place. The financial sector is suffering from a lower inflow of capital related to mineral revenues and the quasiclosure of international financial markets to Russian entities, as seen in the reduced availability of loans and venture capital.

Saudi Arabia comes in at 29th, losing four places mainly as a result of a deteriorating macroeconomic environment following the drop in energy prices. The country has recently revealed its ambitious economic development program, which aims at widespread diversification of the economy in order to reduce dependence on oil by 2030. Achieving higher diversification will require building capacities in high-end industries and

services sectors. Strengthening education, particularly in terms of the quality of math and science training but also in management and primary education, will be necessary, but so will a more flexible labor market that ensures that talent is used efficiently. Significant potential for improvement also exists in financial market development, which remains less stable than in peer economies.

Singapore ranks 2nd for the sixth year in a row thanks to a remarkably strong performance. It features in the top 10 of ten pillars. It tops the higher education and training pillar and the goods market efficiency pillar, and ranks 2nd in a further five. Singapore's public institutions (2nd behind Finland) are transparent and highly efficient (1st on public-sector performance). Its infrastructures are among the world's best (2nd behind

Hong Kong). Singapore boasts a stable macroeconomic environment (11th) with healthy public finances (government budget has been in surplus since 2010). Singapore still lags behind the best-performing nations in the most sophisticated areas of competitiveness, with a relatively disappointing 19th rank in the business sophistication pillar and 9th rank in the innovation pillar.

South Africa slightly improves both its score and ranking (47th, up two). It has been relatively less affected by commodity price falls than other economies in the region, and has registered marginal improvements in almost all aspects of competitiveness. Most significant areas of progress include enhanced competition, both locally (up 13 places) and internationally (up 16 places); better use of talent in terms of how pay reflects productivity (98th, up 29 places); and a small but important upgrade in the quality of education (up five places), with primary school enrollment also now passing 97 percent. However, a number of shortcomings may limit South African

competitiveness going forward. Infrastructure development has stalled, both in transport and electricity, with power shortages experienced this year. Institutional quality has diminished, with increased political uncertainty, less transparency, some security concerns, and business leaders having less trust in politicians (down 11 places since last year). The slowdown of the Chinese economy and exchange rate volatility may dampen growth, now forecast at 0.1 percent for 2016. This makes it unlikely that the high unemployment rate will diminish soon, hampering the ability to leverage Africa's demographic dividend.

Most problematic factors for doing business

Sweden moves up three places to 6th with improvements in the basic factors of competitiveness, especially the macroeconomic environment. Growth has been robust, at 3.7 percent in 2016, and the country has managed to significantly decrease its deficit in 2015, jumping 30 places to 22nd on this indicator. The labor market functions reasonably well and Sweden has a high employment rate, with a high level of women's participation in the workforce. However, there is still room for improvement in labor market flexibility: Sweden has dropped 26 places to 120th in the effect of taxation on incentives to work, and restrictive labor regulations are perceived as the second most problematic factor for doing business. The country also faces a difficult housing market: a continued increase in house prices could impede mobility and negatively impact labor market efficiency. Sweden is well equipped to embrace the Fourth Industrial Revolution, with a strong score on technological readiness and ranked within the top 10 in innovation. However, the availability of scientists and engineers is falling (down six places to 20th)—a reminder that renewed efforts to invest in human capital and skills are necessary to ensure long-term competitiveness and innovation capacity.

For the eighth consecutive year, Switzerland tops the GCI, achieving an even higher score than in previous years. Although its performance remains largely unchanged from last year, a small score improvement means Switzerland achieves the highest GCI score since the introduction of the current methodology in 2007. The country features in the top 10 of 11 GCI pillars and tops four of them: labor market efficiency, business sophistication, innovation, and technological readiness (for the first time). Switzerland arguably possesses one of the world's most fertile innovation ecosystems, combining a very conducive policy environment and infrastructure, academic excellence, an unmatched capacity to attract the

best talent, and large multinationals that are often leaders in their sector as well as a dense network of small- and medium-sized enterprises across sectors that has a reputation for quality and a strive for innovation. Furthermore, intense collaboration between the academic and business worlds yields innovative products with commercial applications. Among the country's relative weaknesses are the persistent and deepening deflation (1.1 percent in 2015), the relative lack of market competition, hindrances to business creation, relatively high barriers to entry, and the low level of women's participation in the labor force in comparison with other advanced economies.

Turkey drops four places to 55th (note that the data were collected before the attempted coup in July 2016). Nevertheless, considering the unstable geopolitical situation in neighboring countries and the pressures from migration—Turkey accounts for 56 percent of all registered Syrian refugees -the country has proven economically resilient. Its relative strengths include infrastructure, despite a lower score this year, and its macroeconomic environment (up 14 places to 54th) - in the face of persistently high inflation, the fall in oil prices has helped the country reduce its government budget deficit and debt. Turkey has made gains in higher education and training (up five places to 50th), increasing enrollment rates in secondary and tertiary education. However, building a highly skilled workforce will require

improving the quality of education and investing in on-the-job training. Weaknesses in the labor market (126th) need to be urgently addressed through structural reforms to increase flexibility and use talent more efficiently. To create a more dynamic business environment, domestic competition needs to be improved (Turkey drops 11 places to 53rd), and investments are needed to develop a sound innovation ecosystem to help the country move up the global value chain. This includes improving business sophistication and fostering companies' innovation by boosting workforce qualifications—the quality of scientific research institutions drops this year to 103rd. Reforms are also needed to make public institutions more efficient and transparent.

Most problematic factors for doing business

Source: World Economic Forum, Executive Opinion Survey 2016

Note: From the list of factors, respondents to the World Economic Forum's Executive Opinion Survey were asked to select the five most problematic factors for doing business in their country and to rank them between 1 (most problematic) and 5. The score corresponds to the responses weighted according to their rankings

Turkey

Most problematic factors for doing business

Source: World Economic Forum, Executive Opinion Survey 2016

Note: From the list of factors, respondents to the World Economic Forum's Executive Opinion Survey were asked to select the five most problematic factors for doing business in their country and to rank them between 1 (most problematic) and 5. The score corresponds to the responses weighted according to their rankings.

* 12th pillar: Innovation	25	4.6				United Arab E	Emirates	Middle E	ast and North	Africa

The United Arab Emirates (UAE) improves by one place to 16th as it continues to lead the Middle East and North Africa region, building on improvements in competitiveness in recent years. This year small gains in areas such as technological adoption and business sophistication are partially offset by deteriorating macroeconomic stability that is the result of lower energy prices, which have led to a rise in inflation and public debt and to the emergence of a fiscal deficit. Overall, the UAE boasts a number of

competitive strengths: infrastructure is top notch (4th overall) and goods and labor markets are open and efficient. Going forward, for the country to diversify its economy, enhancing innovation—where the country currently ranks 25th—will be crucial. There is equal scope for better leveraging digital technologies that are an important enabler of business innovation. Currently the country ranks 29th in ICT use.

Most problematic factors for doing business

Currently the United Kingdom is still one of the most competitive economies in the world, moving up three places to 7th on the back of marginal score improvements. Note that the data were collected before the Brexit vote, so initial repercussions from the vote are not captured by this year's Index. Although the process and the conditions of Brexit are still unknown, it is likely to have a negative impact on the United Kingdom's competitiveness through goods and financial markets as well as market size and, potentially, innovation. Competitiveness of the UK economy has, up to now, rested on

highly efficient goods and labor markets (9th and 5th, respectively); business processes are highly sophisticated (7th) and supported by a high level of digital readiness by both businesses and consumers (3rd). Last year saw a partial recovery in the macroeconomic environment (up 23 to 85th) and an improvement in financial market conditions, although in general scores were mostly stable. Brexit will likely alter the competitiveness situation in the United Kingdom. For a detailed discussion of its potential impacts, see Box 5 in chapter 1.1 of The Global Competitiveness Report 2016-2017.

Most problematic factors for doing business

Source: World Economic Forum, Executive Opinion Survey 2016

Note: From the list of factors, respondents to the World Economic Forum's Executive Opinion Survey were asked to select the five most problematic factors for doing business in their country and to rank them between 1 (most problematic) and 5. The score corresponds to the responses weighted according to their rankings

United Kingdom

The United States remains stable overall in 3rd position, showing improvement in areas including macroeconomic stability, the result of a declining budget deficit. Non-tariff barriers appear less burdensome than in the past. However, stagnating productivity has called for a downward revision of growth prospects, highlighting the need for a renewed competitiveness agenda even in the top-ranking economies. Despite being in the top 10 best-ranked economies and recent positive news from the Current Population Report 2016 showing recovering income growth across all income groups, the United States does not rank in the top 10 on any of the basic requirements pillars (institutions, infrastructure, macroeconomic

environment, health and primary education). On the efficiency enhancers subindex, it is not within the top 10 on goods market efficiency or technological adoption. The position of the United States is driven by innovation, business sophistication, market size, financial market development, labor market efficiency, and higher education and training. These findings highlight important challenges if the country is to remain in the top 10 over the long term, and possible bottlenecks indicating the supply-side constraints that are holding back progress and reducing the effectiveness of monetary policy for jump-starting growth.

Most problematic factors for doing business

Source: World Economic Forum, Executive Opinion Survey 2016

Note: From the list of factors, respondents to the World Economic Forum's Executive Opinion Survey were asked to select the five most problematic factors for doing business in their country and to rank them between 1 (most problematic) and 5. The score corresponds to the responses weighted according to their rankings.

Most problematic factors for doing business Source: World Economic Forum, Executive Opinion Survey 2016

Note: From the list of factors, respondents to the World Economic Forum's Executive Opinion Survey were asked to select the five most problematic factors for doing business in their country and to rank them between 1 (most problematic) and 5. The score corresponds to the responses weighted according to their rankings.

Technical Notes and Sources

The data in this Report represent the best available estimates from various national authorities, international agencies, and private sources at the time the Report was prepared. It is possible that some data will have been revised or updated by the sources after publication. The following notes provide sources for all the indicators composing the Global Competitiveness Index. The title of each indicator appears on the first line, preceded by its number to allow for quick reference. The numbering is consistent with the one adopted in Appendix A of Chapter 1.1. Below is a description of each indicator or, in the case of Executive Opinion Survey data, the full question and associated answers. If necessary, additional information is provided underneath.

Pillar 1: Institutions

1.01 Property rights

In your country, to what extent are property rights, including financial assets, protected? [1 = not at all; 7 = to a great extent] 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.02 Intellectual property protection

In your country, to what extent is intellectual property protected? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.03 Diversion of public funds

In your country, how common is illegal diversion of public funds to companies, individuals, or groups? [1 = very commonly occurs; 7 = never occurs] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.04 Public trust in politicians

In your country, how do you rate the ethical standards of politicians? [1 = extremely low; 7 = extremely high] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey, For more details, refer to Chapter 1.3 of this Report

1.05 Irregular payments and bribes

Average score across the five components of the following Executive Opinion Survey question: In your country, how common is it for firms to make undocumented extra payments or bribes connected with (a) imports and exports; (b) public utilities; (c) annual tax payments; (d) awarding of public contracts and licenses: (e) obtaining favorable judicial decisions? In each case, the answer ranges from 1 [very common] to 7 [never occurs] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.06 Judicial independence

In your country, how independent is the judicial system from influences of the government, individuals, or companies? [1 = not independent at all; 7 = entirely independent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.07 Favoritism in decisions of government officials

In your country, to what extent do government officials show favoritism to well-connected firms and individuals when deciding upon policies and contracts? [1 = show favoritism to a great extent; 7 = do not show favoritism at all] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.08 Wastefulness of government spending

In your country, how efficiently does the government spend public revenue? [1 = extremely inefficient; 7 = extremely efficient in providing goods and services] | 2013-14 weighted

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.09 Burden of government regulation

In your country, how burdensome is it for companies to comply with public administration's requirements (e.g., permits, regulations, reporting)? [1 = extremely burdensome; 7 = not burdensome at all] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.10 Efficiency of legal framework in settling disputes

In your country, how efficient are the legal and judicial systems for companies in settling disputes? [1 = extremely inefficient; 7 = extremely efficient] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.11 Efficiency of legal framework in challenging regulations

In your country, how easy is it for private businesses to challenge government actions and/or regulations through the legal system? [1 = extremely difficult; 7 = extremely easy] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.12 Transparency of government policymaking

In your country, how easy is it for companies to obtain information about changes in government policies and regulations affecting their activities? [1 = extremely difficult; 7 = extremely easy] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.13 Business costs of terrorism

In your country, to what extent does the threat of terrorism impose costs on businesses? [1 = to a great extent, imposes huge costs; 7 = no costs at all] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.14 Business costs of crime and violence

In your country, to what extent does the incidence of crime and violence impose costs on businesses? [1 = to a great extent, imposes huge costs; 7 = no costs at all] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.15 Organized crime

In your country, to what extent does organized crime (mafiaoriented racketeering, extortion) impose costs on businesses? [1 = to a great extent, imposes huge costs; 7 = no costs at all] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.16 Reliability of police services

In your country, to what extent can police services be relied upon to enforce law and order? [1 = not at all; 7 = to a great extent] | 2016

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.17 Ethical behavior of firms

In your country, how do you rate the corporate ethics of companies (ethical behavior in interactions with public officials, politicians, and other firms)? [1 = extremely poor—among the worst in the world; 7 = excellent—among the best in the world] 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.18 Strength of auditing and reporting standards

In your country, how strong are financial auditing and reporting standards? [1 = extremely weak; 7 = extremely strong] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.19 Efficacy of corporate boards

In your country, to what extent is management accountable to investors and boards of directors? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.20 Protection of minority shareholders' interests

In your country, to what extent are the interests of minority shareholders protected by the legal system? [1 = not protected at all; 7 = fully protected] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

1.21 Strength of investor protection

Strength of Investor Protection Index on a 0–10 (best) scale | 2015

This variable is a combination of the Extent of disclosure index (transparency of transactions), the Extent of director liability index (liability for self-dealing), and the Ease of shareholder suit index (shareholders' ability to sue officers and directors for misconduct). For more details about the methodology employed and the assumptions made to compute this indicator, visit http://www. doingbusiness.org/methodologysurveys/.

Source: World Bank/International Finance Corporation, Doing Business 2016: Measuring Regulatory Quality and Efficiency

Pillar 2: Infrastructure

2.01 Quality of overall infrastructure

How do you assess the general state of infrastructure (e.g., transport, communications, and energy) in your country? [1 = extremely underdeveloped—among the worst in the world; 7 = extensive and efficient—among the best in the world] \mid 2015–16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

2.02 Quality of roads

In your country, how is the quality (extensiveness and condition) of road infrastructure [1 = extremely poor-among the worst in the world; 7 = extremely good—among the best in the world] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

2.03 Quality of railroad infrastructure

In your country, how is the quality (extensiveness and condition) of the railroad system [1 = extremely poor—among the worst in the world; 7 = extremely good—among the best in the world] | 2015-16 weighted average

For economies where there is no regular train service or where the network covers only a negligible portion of the territory this indicator is not used in the calculation, and in the Country/ Economy Profiles of these economies, N/Appl is used for this

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

2.04 Quality of port infrastructure

In your country, how is the quality (extensiveness and condition) of seaports (for landlocked countries, assess access to seaports) [1 = extremely poor—among the worst in the world; 7 = extremely good—among the best in the world] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

2.05 Quality of air transport infrastructure

In your country, how is the quality (extensiveness and condition) of airports [1 = extremely poor—among the worst in the world; 7 = extremely good—among the best in the world] 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

2.06 Available airline seat kilometers

Airline seat kilometers (in millions) available on all flights (domestic and international service) originating in country per week (year average) | Monthly average for 2016

This indicator measures the total passenger-carrying capacity of all scheduled flights, including domestic flights, originating in a country. It is computed by multiplying the number of seats available on each flight by the flight distance in kilometers and summing the result across all scheduled flights in a week. The final value represents the weekly average for the year (Jan-Dec), taking into account flights scheduled beforehand by airline

Source: International Air Transport Association, SRS Analyser

2.07 Quality of electricity supply

In your country, how reliable is the electricity supply (lack of interruptions and lack of voltage fluctuations)? [1 = extremely unreliable; 7 = extremely reliable] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

2.08 Mobile-cellular telephone subscriptions

Number of mobile-cellular telephone subscriptions per 100 population | 2015

Mobile-cellular telephone subscriptions refers to the number of subscriptions to a public mobile telephone service that provides access to the public switched telephone network (PSTN) using cellular technology. It includes both the number of postpaid subscriptions and the number of active prepaid accounts (i.e., that have been active during the past three months). It includes all mobile-cellular subscriptions that offer voice communications. It excludes subscriptions via data cards or USB modems, subscriptions to public mobile data services, and private trunked mobile radio, telepoint, radio paging, and telemetry services.

Source: International Telecommunication Union, ITU World Telecommunication/ICT Indicators June 2016 (June 2016 edition)

2.09 Fixed-telephone lines

Number of fixed-telephone lines per 100 population | 2015

Fixed-telephone subscriptions refers to the sum of active analogue fixed-telephone lines, voice over IP (VoIP) subscriptions, fixed wireless local loop (WLL) subscriptions, ISDN voice-channel equivalents, and fixed-public payphones. It includes all accesses over fixed infrastructure supporting voice telephony using copper wire, voice services using Internet Protocol (IP) delivered over fixed (wired)-broadband infrastructure (e.g., DSL, fiber optic), and voice services provided over coaxial-cable television networks (cable modem). It also includes WLL connections, which are defined as services provided by licensed fixed-line telephone operators that provide last-mile access to the subscriber using radio technology, when the call is then routed over a fixed-line telephone network (and not a mobile-cellular network). In the case of VoIP, it refers to subscriptions that offer the ability to place and receive calls at any time and do not require a computer. VoIP is also known as voice-over broadband (VoB), and includes subscriptions through fixed-wireless, DSL, cable, fiber optic, and other fixed-broadband platforms that provide fixed telephony using IP.

Pillar 3: Macroeconomic environment

3.01 Government budget balance

General government budget balance as a percentage of GDP

General government budget balance is calculated as general government revenue minus total expenditure. This is a core Government Finance Statistics (GFS) balance that measures the extent to which the general government is either putting financial resources at the disposal of other sectors in the economy and nonresidents (net lending), or utilizing the financial resources generated by other sectors and nonresidents (net borrowing). This balance may be viewed as an indicator of the financial impact of general government activity on the rest of the economy and nonresidents. Revenue consists of taxes, social contributions, grants receivable, and other revenue. Revenue increases a government's net worth, which is the difference between its assets and liabilities. General government total expenditure consists of total expenses and the net acquisition of nonfinancial

Source: International Monetary Fund, World Economic Outlook Database (April 2016 edition)

3.02 Gross national savings

Gross national savings as a percentage of GDP | 2015 or most recent year available

Gross national savings is expressed as a ratio of gross national savings in current local currency and GDP in current local currency. It corresponds to gross disposable income less final consumption expenditure after taking account of an adjustment for pension funds. For many economies, the estimates of national savings are built up from national accounts data on gross domestic investment and from balance of payments-based data on net foreign investment.

Sources: International Monetary Fund, World Economic Outlook Database (April 2016 edition); US Central Intelligence Agency, The World Factbook (accessed August 12, 2016); national sources

3.03 Inflation

Annual percent change in consumer price index (year average) 2015 or most recent year available

Source: International Monetary Fund, World Economic Outlook Database (April 2016 edition)

3.04 Government debt

Gross general government debt as a percentage of GDP | 2015 or most recent year available

Gross debt consists of all liabilities that require payment or payments of interest and/or principal by the debtor to the creditor at a date or dates in the future. This includes debt liabilities in the form of special drawing rights, currency and deposits, debt securities, loans, insurance, pensions and standardized guarantee schemes, and other accounts payable. Thus all liabilities in the Government Finance Statistics Manual (GFSM) 2001 system are debt, except for equity and investment fund shares, financial derivatives, and employee stock options. For Australia, Belgium, Canada, Hong Kong SAR, Iceland, New Zealand, and Sweden, government debt coverage also includes insurance technical reserves, following the GFSM 2001 definition.

3.05 Country credit rating

Institutional Investor's Country Credit Ratings™ assessing the probability of sovereign debt default on a 0-100 (lowest probability) scale | March 2016

Institutional Investor's Country Credit Ratings™ developed by Institutional Investor are based on information provided by senior economists and sovereign-debt analysts at leading global banks and money management and security firms. Twice a year, the respondents grade each country on a scale of 0 to 100, with 100 representing the least chance of default.

Pillar 4: Health and primary education

4.01 Malaria incidence

Estimated number of malaria cases per 100,000 population | 2013 or most recent year available

For economies that: (1) were declared free of malaria by the World Health Organization (WHO) (except in the case of Hong Kong SAR, for which malaria assessment is from CDC); (2) are included in the WHO's supplementary list of areas where malaria has never existed or has disappeared without specific measures; or (3) are currently in the prevention of reintroduction phase as identified by the WHO, this indicator is excluded from the calculation of the

In the Country/Economy profiles of these economies, the following abbreviations are used: M.F. for malaria-free economies; P.R. means the economy is in the prevention of reintroduction phase; and S.L. means the economy is on the WHO's supplementary list.

Sources: The World Health Organization, World Malaria Report 2012 and 2015 editions; United States Centers for Disease Control and Prevention (CDC), Malaria Information and Prophylaxis information (accessed July 29, 2016).

4.02 Business impact of malaria

How serious an impact do you consider malaria will have on your company in the next five years (e.g., death, disability, medical and funeral expenses, productivity and absenteeism, recruitment and training expenses, revenues)? [1 = a serious impact; 7 = no impact at all] | 2013-14 weighted average For economies that are considered free of malaria; that are included in the World Health Organization's supplementary list; or that are in the prevention of reintroduction phase (see indicator 4.01 above), this indicator is excluded from the calculation of the GCI. In the Country/Economy Profiles of these economies, $\ensuremath{\mathcal{N}}$ Appl. is used for this indicator.

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

4.03 Tuberculosis incidence

Estimated number of tuberculosis cases per 100,000 population | 2014 or most recent year available

Incidence of tuberculosis is the estimated number of new pulmonary, smear positive, and extra-pulmonary tuberculosis

Sources: The World Bank, World Development Indicators (accessed May19, 2016); national sources

4.04 Business impact of tuberculosis

How serious an impact do you consider tuberculosis will have on your company in the next five years (e.g., death, disability, medical and funeral expenses, productivity and absenteeism, recruitment and training expenses, revenues)? [1 = a serious impact; 7 = no impact at all] | 2013-14 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

4.05 HIV prevalence

HIV prevalence as a percentage of adults aged 15-49 years | 2014 or most recent year available

HIV prevalence refers to the percentage of people aged 15-49 who are infected with HIV at a particular point in time, no matter when infection occurred. Economies with a prevalence rate equal to or less than 0.2 percent are all ranked first.

Sources: The World Bank, World Development Indicators (accessed May 18, 2015, and May 19, 2016); UNAIDS, UNAIDS Global Report on the Global AIDS Epidemic (2008, 2010, 2012, and 2013 editions); UNAIDS, IUNAIDS Gap Report 2014; national sources

4.06 Business impact of HIV/AIDS

How serious an impact do you consider HIV/AIDS will have on your company in the next five years (e.g., death, disability, medical and funeral expenses, productivity and absenteeism, recruitment and training expenses, revenues)? [1 = a serious impact; 7 = no impact at all] | 2013-14 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

4.07 Infant mortality

Infant (children aged 0-12 months) mortality per 1,000 live births | 2015 or most recent year available

Infant mortality rate is the number of infants dying before reaching one year of age per 1,000 live births in a given year.

Sources: The World Bank, World Development Indicators (accessed July 5, 2016); national sources

4.08 Life expectancy

Life expectancy at birth (years) | 2014

Life expectancy at birth indicates the number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life.

Sources: The World Bank, World Development Indicators (accessed July 5, 2016); national sources

4.09 Quality of primary education

In your country, how do you assess the quality of primary education [1 = extremely poor—among the worst in the world; 7 = excellent—among the best in the world] | 2015–16 weighted average

Source: World Economic Forum, Executive Opinion Survey, For more details, refer to Chapter 1.3 of this Report

4.10 Primary education enrollment rate

Net primary education enrollment rate | 2014 or most recent year available

The reported value corresponds to the ratio of children of official primary school age (as defined by the national education system) who are enrolled in primary school. Primary education (ISCED level 1) provides children with basic reading, writing, and mathematics skills along with an elementary understanding of such subjects as history, geography, natural science, social science, art, and music.

Sources: UNESCO Institute for Statistics, Data Centre (accessed July 12, 2016); Organisation for Economic Co-operation and Development (OECD), Education at a Glance 2015; UNICEF; national sources

Pillar 5: Higher education and training

5.01 Secondary education enrollment rate

Gross secondary education enrollment rate | 2014 or most recent year available

The reported value corresponds to the ratio of total secondary enrollment, regardless of age, to the population of the age group that officially corresponds to the secondary education level. Secondary education (ISCED levels 2 and 3) completes the provision of basic education that began at the primary level, and aims to lay the foundations for lifelong learning and human development by offering more subject- or skills-oriented instruction using more specialized teachers.

Sources: UNESCO Institute for Statistics, Data Centre (accessed July 12, 2016); national sources

5.02 Tertiary education enrollment rate

Gross tertiary education enrollment rate | 2014 or most recent year available

The reported value corresponds to the ratio of total tertiary enrollment, regardless of age, to the population of the age group that officially corresponds to the tertiary education level. Tertiary education (ISCED levels 5 and 6), whether or not leading to an advanced research qualification, normally requires, as a minimum condition of admission, the successful completion of education at the secondary level.

Sources: UNESCO Institute for Statistics, Data Centre (accessed July 12, 2016); national sources

5.03 Quality of the education system

In your country, how well does the education system meet the needs of a competitive economy? [1 = not well at all; 7 = extremely well] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

5.04 Quality of math and science education

In your country, how do you assess the quality of math and science education? [1 = extremely poor—among the worst in the world; 7 = excellent-among the best in the world] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

5.05 Quality of management schools

In your country, how do you assess the quality of management schools? [1 = extremely poor—among the worst in the world; 7 = excellent-among the best in the world] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey, For more details, refer to Chapter 1.3 of this Report

5.06 Internet access in schools

In your country, to what extent is the Internet used in schools for learning purposes? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

5.07 Local availability of specialized training services

vln your country, how available are high-quality, professional training services? [1 = not available at all; 7 = widely available] 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

5.08 Extent of staff training

In your country, to what extent do companies invest in training and employee development? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

Pillar 6: Goods market efficiency

6.01 Intensity of local competition

In your country, how intense is competition in the local markets? [1 = not intense at all; 7 = extremely intense] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

6.02 Extent of market dominance

In your country, how do you characterize corporate activity? [1 = dominated by a few business groups; 7 = spread among many firms] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

6.03 Effectiveness of anti-monopoly policy

In your country, how effective are anti-monopoly policies at ensuring fair competition? [1 = not effective at all; 7 = extremely effective] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

6.04 Effect of taxation on incentives to invest

In your country, to what extent do taxes reduce the incentive to invest? [1 = to a great extent; 7 = not at all] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

6.05 Total tax rate

This variable is a combination of profit tax (% of profits), labor tax and contribution (% of profits), and other taxes (% of

The total tax rate measures the amount of taxes and mandatory contributions payable by a business in the second year of operation, expressed as a share of commercial profits. The total amount of taxes is the sum of five different types of taxes and contributions payable after accounting for deductions and exemptions: profit or corporate income tax, social contributions and labor taxes paid by the employer, property taxes, turnover taxes, and other small taxes. For more details about the methodology employed and the assumptions made to compute this indicator, visit http://www.doingbusiness.org/ methodologysurveys/.

Source: World Bank/International Finance Corporation, Doing Business 2016: Measuring Regulatory Quality and Efficiency

6.06 Number of procedures required to start a business

Number of procedures required to start a business | 2015

For details about the methodology employed and the assumptions made to compute this indicator, visit http://www. doingbusiness.org/methodologysurveys/.

Source: World Bank/International Finance Corporation, Doing Business 2016: Measuring Regulatory Quality and Efficiency

6.07 Time required to start a business

Number of days required to start a business | 2015

For details about the methodology employed and the assumptions made to compute this indicator, visit http://www. doingbusiness.org/methodologysurveys/.

Source: World Bank/International Finance Corporation, Doing Business 2016: Measuring Regulatory Quality and Efficiency

6.08 Agricultural policy costs

In your country, how do you assess the agricultural policy? [1 = excessively burdensome for the economy; 7 = balances well the interests of taxpayers, consumers, and producers] 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

6.09 Prevalence of non-tariff barriers

In your country, to what extent do non-tariff barriers (e.g., health and product standards, technical and labeling requirements, etc.) limit the ability of imported goods to compete in the domestic market? [1 = strongly limit; 7 = do not limit at all] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

6.10 Trade tariffs

Trade-weighted average tariff rate | 2015 or most recent year

An applied tariff is a customs duty that is levied on imports of merchandise goods. This indicator is calculated as a weighted average of all the applied tariff rates, including preferential rates that a country applies to the rest of the world. The weights are the trade patterns of the importing country's reference group.

Sources: International Trade Centre; Trade Competitiveness Map Data

6.11 Prevalence of foreign ownership

In your country, how prevalent is foreign ownership of companies? [1 = extremely rare; 7 = extremely prevalent] 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

6.12 Business impact of rules on FDI

In your country, how restrictive are rules and regulations on foreign direct investment (FDI)? [1 = extremely restrictive; 7 = not restrictive at all] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

6.13 Burden of customs procedures

In your country, how efficient are customs procedures (related to the entry and exit of merchandise)? [1 = extremely inefficient; 7 = extremely efficient] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

6.14 Imports as a percentage of GDP

Imports of goods and services as a percentage of gross domestic product | 2015 or most recent year available Total imports is the sum of total imports of merchandise and commercial services.

Sources: World Trade Organization, Online Statistics Database (accessed June 08, 2016); International Monetary Fund, World Economic Outlook Database (April 2016 edition); national sources

6.15 Degree of customer orientation

In your country, how well do companies treat customers? [1 = poorly—mostly indifferent to customer satisfaction; 7 = extremely well—highly responsive to customers and seek customer retention] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

6.16 Buyer sophistication

In your country, on what basis do buyers make purchasing decisions? [1 = based solely on the lowest price; 7 = based on sophisticated performance attributes] | 2015-16 weighted

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

Pillar 7: Labor market efficiency

7.01 Cooperation in labor-employer relations

In your country, how do you characterize labor-employer relations? [1 = generally confrontational; 7 = generally cooperative] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

7.02 Flexibility of wage determination

In your country, how are wages generally set? [1 = by a centralized bargaining process; 7 = by each individual company] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

7.03 Hiring and firing practices

In your country, to what extent do regulations allow flexible hiring and firing of workers? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

7.04 Redundancy costs

Redundancy costs in weeks of salary | 2015

This variable estimates the cost of advance notice requirements, severance payments, and penalties due when terminating a redundant worker, expressed in weekly wages. For more details about the methodology employed and the assumptions made to compute this indicator, visit http://www.doingbusiness.org/ methodologysurveys/.

Sources: World Bank/International Finance Corporation, Doing Business 2016: Measuring Regulatory Quality and Efficiency; World Economic Forum's calculations

7.05 Effect of taxation on incentives to work

In your country, to what extent do taxes and social contributions reduce the incentive to work? [1 = to a great extent; 7 = not at all] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

7.06 Pay and productivity

In your country, to what extent is pay related to employee productivity? [1 = not at all; 7 = to a great extent] | 2015-16weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

7.07 Reliance on professional management

In your country, who holds senior management positions in companies? [1 = usually relatives or friends without regard to merit; 7 = mostly professional managers chosen for merit and qualifications] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

7.08 Country capacity to retain talent

To what extent does your country retain talented people? [1 = not at all—the best and brightest leave to pursue opportunities abroad: 7 = to a great extent—the best and brightest stay and pursue opportunities in the country] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

7.09 Country capacity to attract talent

To what extent does your country attract talented people from abroad? [1 = not at all; 7 = to a great extent—the country attracts the best and brightest from around the world] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

7.10 Female participation in the labor force

Ratio of women to men in the labor force | 2015

This measure is the percentage of women aged 15-64 participating in the labor force divided by the percentage of men aged 15-64 participating in the labor force.

Sources: International Labour Organization, Key Indicators of the Labour Markets. 9th Edition: national sources

Pillar 8: Financial market development

8.01 Financial services meeting business needs

In your country, to what extent does the financial sector provide the products and services that meet the needs of businesses? [1 = not at all; 7 = to a great extent] | 2015–16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

8.02 Affordability of financial services

In your country, to what extent does the cost of financial services (e.g., insurance, loans, trade finance) impede business activity? [1 = impedes business to a great extent; 7 = not at all] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

8.03 Financing through local equity market

In your country, to what extent can companies raise money by issuing shares and/or bonds on the capital market? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

8.04 Ease of access to loans

In your country, how easy is it for businesses to obtain a bank loan? [1 = extremely difficult; 7 = extremely easy] | 2016

Source: World Economic Forum, Executive Opinion Survey, For more details, refer to Chapter 1.3 of this Report

8.05 Venture capital availability

In your country, how easy is it for start-up entrepreneurs with innovative but risky projects to obtain equity funding? [1 = extremely difficult; 7 = extremely easy] | 2015-16 weighted

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

8.06 Soundness of banks

In your country, how do you assess the soundness of banks? [1 = extremely low—banks may require recapitalization; 7 = extremely high—banks are generally healthy with sound balance sheets] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

8.07 Regulation of securities exchanges

In your country, to what extent do regulators ensure the stability of the financial market? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

8.08 Legal rights index

Degree of legal protection of borrowers' and lenders' rights on a 0-12 (best) scale | 2015

This index measures the degree to which collateral and bankruptcy laws protect borrowers' and lenders' rights and thus facilitate lending. For more details about the methodology employed and the assumptions made to compute this indicator, visit http://www.doingbusiness.org/methodologysurveys/.

Source: World Bank/International Finance Corporation, Doing Business 2016: Measuring Regulatory Quality and Efficiency

Pillar 9: Technological readiness

9.01 Availability of latest technologies

In your country, to what extent are the latest technologies available? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

9.02 Firm-level technology absorption

In your country, to what extent do businesses adopt the latest technologies? [1 = not at all; 7 = to a great extent] | 2016

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

9.03 FDI and technology transfer

To what extent does foreign direct investment (FDI) bring new technology into your country? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

9.04 Internet users

Percentage of individuals using the Internet | 2015

Individuals using the Internet refers to people who used the Internet from any location and for any purpose, irrespective of the device and network used, in the last three months. It can be via a computer (i.e., desktop computer, laptop computer or tablet, or similar handheld computer), mobile phone, games machine, digital TV, etc. Access can be via a fixed or mobile network.

Source: International Telecommunication Union, ITU World Telecommunication/ICT Indicators June 2016 (June 2016 edition)

9.05 Fixed-broadband Internet subscriptions

Fixed-broadband Internet subscriptions per 100 population | 2015 or most recent year available

Fixed (wired)-broadband subscriptions refers to the number of subscriptions for high-speed access to the public Internet (a TCP/ IP connection). Highspeed access is defined as downstream speeds equal to, or greater than, 256 kbit/s, Fixed (wired)broadband includes cable modem, DSL, fiber, and other fixed (wired)-broadband technologies-such as Ethernet LAN, and broadband over powerline (BPL) communications. Subscriptions with access to data communications (including the Internet) via mobile-cellular networks are excluded.

Source: International Telecommunication Union, ITU World Telecommunication/ICT Indicators June 2016 (June 2016 edition)

9.06 Internet bandwidth

International Internet bandwidth (kb/s) per Internet user | 2015 or most recent year available

International Internet bandwidth refers to the total used capacity of international Internet bandwidth, in megabits per second (Mbit/s). It is measured as the sum of used capacity of all Internet exchanges offering international bandwidth. If capacity is asymmetric, then the incoming capacity is used. International Internet bandwidth (kbit/s) per Internet user is calculated by converting the speed from megabits to kilobits per second and dividing by the total number of Internet users.

Source: International Telecommunication Union, ITU World Telecommunication/ICT Indicators June 2016 (June 2016 edition)

9.07 Mobile-broadband subscriptions

Active mobile-broadband subscriptions per 100 population | 2015

Active mobile-broadband subscriptions refers to the sum of standard mobile-broadband subscriptions and dedicated mobilebroadband data subscriptions to the public Internet. It covers actual subscribers, not potential subscribers, even though the latter may have broadband-enabled handsets. Standard mobile-broadband subscriptions refers to active mobile-cellular subscriptions with advertised data speeds of 256 kbit/s or greater that allow access to the greater Internet via HTTP and that have been used to set up an Internet data connection using Internet Protocol (IP) in the past three months. Standard SMS and MMS messaging do not count as an active Internet data connection, even if the messages are delivered via IP. Dedicated mobile-broadband data subscriptions refers to subscriptions to dedicated data services (over a mobile network) that allow access to the greater Internet and that are purchased separately from voice services, either as a standalone service (e.g., using a data card such as a USB modem/dongle) or as an add-on data package to voice services that requires an additional subscription. All dedicated mobile-broadband subscriptions with recurring subscription fees are included regardless of actual use. Prepaid mobile-broadband plans require use if there is no monthly subscription. This indicator could also include mobile WiMAX subscriptions.

Source: International Telecommunication Union, ITU World Telecommunication/ICT Indicators June 2016 (June 2016 edition)

Pillar 10: Market size

10.01 Domestic market size index

Sum of gross domestic product plus value of imports of goods and services, minus value of exports of goods and services, normalized on a 1-7 (best) scale | 2015 or most recent year available

The size of the domestic market is calculated as the natural log of the sum of the gross domestic product valued at PPP plus the total value (PPP estimates) of imports of goods and services, minus the total value (PPP estimates) of exports of goods and services. Data are then normalized on a 1-7 scale. PPP estimates of imports and exports are obtained by taking the product of exports as a percentage of GDP and GDP valued at PPP.

Source: World Economic Forum. For more details, refer to the Appendix of Chapter 1.1 of this Report

10.02 Foreign market size index

Value of exports of goods and services, normalized on a 1-7 (best) scale | 2015 or most recent year available

The size of the foreign market is estimated as the natural log of the total value (PPP estimates) of exports of goods and services, normalized on a 1-7 scale. PPP estimates of exports are obtained by taking the product of exports as a percentage of GDP and GDP valued at PPP.

Source: World Economic Forum. For more details, refer to the Appendix of Chapter 1.1 of this Report

10.03 GDP (PPP)

Gross domestic product valued at purchasing power parity in billions of international dollars | 2015

Source: International Monetary Fund, World Economic Outlook Database (April 2016 edition)

10.04 Exports as a percentage of GDP

Exports of goods and services as a percentage of gross domestic product | 2015 or most recent year available

Total exports is the sum of total exports of merchandise and commercial services.

Sources: World Trade Organization, Online Statistics Database (accessed June 08, 2016); International Monetary Fund, World Economic Outlook Database (April 2016 edition); national sources

Pillar 11: Business sophistication

11.01 Local supplier quantity

In your country, how numerous are local suppliers? [1 = largely nonexistent; 7 = extremely numerous] | 2015-16 weighted

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

11.02 Local supplier quality

In your country, how do you assess the quality of local suppliers? [1 = extremely poor quality; 7 = extremely high quality] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

11.03 State of cluster development

In your country, how widespread are well-developed and deep clusters (geographic concentrations of firms, suppliers, producers of related products and services, and specialized institutions in a particular field)? [1 = nonexistent; 7 = widespread in many fields] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

11.04 Nature of competitive advantage

On what is the competitive advantage of your country's companies in international markets based? [1 = primarily lowcost labor or natural resources; 7 = primarily unique products and processes] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

11.05 Value chain breadth

In your country, how broad is companies' presence in the value chain? [1 = narrow, primarily involved in individual steps of the value chain (e.g., resource extraction or production); 7 = broad, present across the entire value chain (e.g., including production, marketing, distribution, design, etc.)] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

11.06 Control of international distribution

In your country, to what extent do domestic companies control the international distribution of their products? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

11.07 Production process sophistication

In your country, how sophisticated are production processes? [1 = not at all—production uses labor-intensive processes; 7 = highly-production uses latest technologies] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

11.08 Extent of marketing

In your country, how successful are companies in using marketing to differentiate their products and services? [1 = not successful at all; 7 = extremely successful] | 2015-16 weighted

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

11.09 Willingness to delegate authority

In your country, how do you assess the willingness to delegate authority to subordinates? [1 = not willing at all-senior management takes all important decisions; 7 = very willingauthority is mostly delegated to business unit heads and other lower-level managers] | 2013-14 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

Pillar 12: Innovation

12.01 Capacity for innovation

In your country, to what extent do companies have the capacity to innovate? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

12.02 Quality of scientific research institutions

In your country, how do you assess the quality of scientific research institutions? [1 = extremely poor—among the worst in the world; 7 = extremely good—among the best in the world] 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

12.03 Company spending on R&D

In your country, to what extent do companies invest in research and development (R&D)? [1 = do not invest at all in R&D; 7 = invest heavily in R&D] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

12.04 University-industry collaboration in R&D

In your country, to what extent do business and universities collaborate on research and development (R&D)? [1 = do not collaborate at all; 7 = collaborate extensively] | 2016

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

12.05 Government procurement of advanced technology products

In your country, to what extent do government purchasing decisions foster innovation? [1 = not at all; 7 = to a great extent] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

12.06 Availability of scientists and engineers

In your country, to what extent are scientists and engineers available? [1 = not available at all; 7 = widely available] | 2015-16 weighted average

Source: World Economic Forum, Executive Opinion Survey. For more details, refer to Chapter 1.3 of this Report

12.07 PCT patent applications

Number of applications filed under the Patent Cooperation Treaty (PCT) per million population | 2012-2013 average

This indicator measures the total count of applications filed under the Patent Cooperation Treaty (PCT), by priority date and inventor nationality, using fractional count if an application is filed by multiple inventors. The average count of applications filed in 2012 and 2013 is divided by population figures for 2013.

In the absence of reliable data on PCT applications for Chinese Taipei and Hong Kong SAR, two advanced economies that are not signatories of the Treaty, the number of applications is estimated as follows: first, we compute the average number of all utility patent applications filed with the United States Patents and Trademarks Office (USPTO) for 2012 and 2013. We then compute the average number of PCT applications for 2012 and 2013, before computing the ratio of the two averages (1.67). For the computation of the two averages, only economies with a two-year average number of at least 100 USPTO applications and 50 PCT applications are considered. Chinese Taipei and Hong Kong are excluded in both cases. We then divide the 2012-2013 average number of USPTO applications filed by residents of Chinese Taipei (20,766) and Hong Kong (1,118), respectively, by the ratio above in order to produce estimates for PCT applications. As a final step, we compute the estimates per million population—that is, 531.6 for Chinese Taipei and 92.6 for Hong Kong. The estimates are used in the computation of the respective Innovation pillar scores of the two economies.

Sources: World Intellectual Property Organization (WIPO) PCT Data, sourced from Organisation for Economic Co-operation and Development (OECD), Patent Database (situation as of June 2016), http://www.oecd.org/sti/inno/oecdpatentdatabases.htm; for population: International Monetary Fund, World Economic Outlook Database (April 2016 edition); World Economic Forum's calculations.

About the Authors

Silja Baller

Silia Baller is Practice Lead for Competitiveness and Innovation with the Forum's Global Competitiveness and Risks Team. She is co-author and co-editor of The Global Information Technology Report, co-author of The Global Competitiveness Report, and leads the Europe Competitiveness and Inclusive Growth Lab. Her areas of expertise include the economics of international trade, digital economy questions, industrial organization, and competition policy. Prior to joining the Forum, she held economist positions at the World Bank, the World Health Organization, and in the London Economics practice of PricewaterhouseCoopers. She holds a BA in Economics from the University of Cambridge; a DEA in International Economics from the Graduate Institute of International Studies, Geneva; and an MPhil and DPhil (PhD) in Economics from the University of Oxford.

Ciara Browne

Ciara Browne is Head of Partnerships with the Global Competitiveness and Risks Team at the World Economic Forum, where her responsibilities include managing partnerships-including institutional and corporate partnerships—and outreach for both competitiveness and risks reports. Ms Browne also oversees the process of implementing the Executive Opinion Survey, which is conducted worldwide and completed by over 15,000 business executives. Ms Browne is involved in the production process of the Team's reports and works closely with the Forum's media team in conveying the findings of the various competitiveness and risks reports to the media and the public. Before joining the Forum, she served for several years with the International Organization for Migration, where she worked for a mass claims processing program. She has a BA (Hons) degree from the University of Manchester (UK).

Roberto Crotti

Roberto Crotti is an Economist with the Global Competitiveness and Risk Team at the World Economic Forum. His responsibilities include the computation, analysis, and management of indexes of competitiveness, including those for The Travel & Tourism Competitiveness Report and The Global Competitiveness Report. His main areas of expertise are applied quantitative methods for policy evaluation, economic growth, and development economics. Prior to joining the Forum, he worked as an analyst in the private consulting sector. Mr Crotti holds a five-year degree in Economics/Economic Policy from Università Cattolica del Sacro Cuore in Milan, Italy, and an MA in Economics from Boston University. He is currently pursuing his doctorate in Development Economics at the Graduate Institute of International Studies (Geneva).

Attilio Di Battista

Attilio Di Battista is a Quantitative Economist with the Global Competitiveness and Risks Team at the World Economic Forum. He works on the development and computation of a range of indexes and is a co-author of various studies, including The Global Information Technology Report 2016 and The Africa Competitiveness Report 2015. His areas of expertise include international trade and competitiveness, institutions and development, investment flows, and financial stability. Prior to joining the Forum, he worked at the International Trade Centre (UNCTAD/WTO) on export strategy, policy, and trade competitiveness analysis. He has a Bachelor's degree in International and Diplomatic Sciences from Università degli Studi di Trieste in Gorizia and a Master in International Economics from the Graduate Institute of International and Development Studies in Geneva.

Margareta Drzeniek Hanouz

Margareta Drzeniek Hanouz is Head of the Global Competitiveness and Risks Team at the World Economic Forum. She leads the Forum's work on national competitiveness and global risks and is lead author or editor of a number of regional and topical reports and papers, including The Global Competitiveness Report and the Global Risks Report series. Before joining the Global Competitiveness and Risks Team, Dr Drzeniek Hanouz was in charge of the economics section of the Forum's Annual Meeting in Davos. Prior to that she worked with the International Trade Centre in Geneva, where she was in charge of relations with Central and Eastern European countries. Dr Drzeniek Hanouz received a Diploma in Economics from the University of Münster and holds a PhD in International Economics from the University of Bochum, both in Germany.

Daniel Gómez Gaviria

Daniel Gómez Gaviria is currently Head of Competitiveness Research at the World Economic Forum. He holds a PhD in Economics with specializations in international trade and industrial organization from the University of Chicago, where he also obtained an MBA from the Booth School of Business and an MA in Economics from the Department of Economics. He completed his degree in Economics at HEC University of Lausanne, where he also completed a Master's in Banking and Finance. Before joining the Forum, Dr Gómez Gaviria was advisor to the Minister of Trade, Industry and Tourism of Colombia and a researcher with Fedesarrollo, the main public policy think tank in Colombia. Before completing his PhD, he was an antitrust consultant with NERA and LECG's European Competition Policy Practices. He also completed the European EC Competition Law diploma at King's College, London. Dr Gómez Gaviria has been a frequent contributor to Revista Dinero, Portafolio, and La Patria, and he was editor of Revista Coyuntura Económica Fedesarrollo. He has been an adjunct professor of Economics at Universidad de los Andes and Universidad Javeriana, in Bogotá, Colombia.

Thierry Geiger

Thierry Geiger is Head of Analytics and Quantitative Research with the Global Competitiveness and Risks Team at the World Economic Forum. In this position he supervises the development and computation of a wide range of composite indicators. In addition, he leads the competitiveness practice on Asia and is responsible for the Team's technical assistance and capacity-building activities. Mr Geiger is co-editor of The Global Enabling Trade Report series and was co-editor of The Global Information Technology Report 2015. He is also a coauthor of The Global Competitiveness Report and lead author of several regional and country studies. A Swiss national, Mr Geiger holds a BA in Economics from the University of Geneva, an MA in Economics from the University of British Columbia, and was a Fellow of the Forum's Global Leadership Programme. Prior to joining the Forum, he worked for the World Trade Organization and Caterpillar Inc. He is a co-founder of Procab Studio, a Geneva-based IT company.

Gaëlle Marti

Gaëlle Marti is an Economist with the Global Competitiveness and Risks Team at the World Economic Forum. Her responsibilities include the overall management of The Global Risks Report process as well as the development and writing of different sections of that report and managing its Advisory Board. She also contributes to the research and drafting of The Global Competitiveness Report. Prior to joining the Forum, she worked at the University of Neuchâtel, Switzerland, as a research assistant, where she conducted a study on the estimation of the medical cost of diabetes. She also worked as a research assistant at the Swiss Health Observatory on various health-related projects. She holds a BSc and an MSc in Economics from the University of Neuchâtel, Switzerland, as well as an MA in International and Development Economics from Yale University.

Xavier Sala-i-Martín

Xavier Sala-i-Martín is a Professor in the Department of Economics at Columbia University. He was previously an Associate Professor at the Department of Economics at Yale University and a Visiting Professor at Universitat Pompeum Fabra. His research interests include economic growth, macroeconomics, public finance and social security, health and population economics, monetary economics, poverty, inequality, estimation of the world distribution of income, and measuring competitiveness. He is a consultant on growth and competitiveness for a number of countries, international institutions, and corporations. Professor Sala-i-Martín is a Research Associate at the National Bureau of Economic Research. He earned his MA and PhD, both in Economics, from Harvard University. He collaborates closely with the World Economic Forum in his capacity as Chief Advisor to the Global Competitiveness Report.

Stéphanie Verin

Stéphanie Verin is Community Specialist with the Global Competitiveness and Risks Team at the World Economic Forum, where she is responsible for managing the network of Partner Institutes worldwide and driving the Executive Opinion Survey process. Her project management responsibilities include the digital transformation journey and the communication of The Global Competitiveness Report—and related benchmarking studies—in close collaboration with the media teams. Before joining the Forum, Ms Verin worked for blue chip multinational companies such as Kellogg's, Mondelēz International, and Nissan. Holder of a Master in Business Administration with a specialization in marketing innovation, she is recognized as a fast-track brand and project manager with experience in driving international commercial and marketing strategic campaigns.

COMMITTED TO IMPROVING THE STATE OF THE WORLD

The Global Competitiveness Report 2016–2017 comes out in the context of persistent slow growth despite unorthodox monetary policy and a near-term outlook that is fraught with renewed uncertainty fueled by continued geopolitical turmoil, financial market fragility, and sustained high debt levels in emerging markets.

On the bright side, tremendous promise for higher economic growth and societal progress dawns with the Fourth Industrial Revolution. Based on digital platforms, the Fourth Industrial Revolution is characterized by a convergence of technologies that is blurring the lines between the physical, digital, and biological spheres.

Yet, as indicated in this *Report*, progress in building an enabling environment for innovation remains the advantage of only a few economies and, since innovation and openness go hand in hand, future growth will also depend on the ability to safeguard the benefits of openness to trade and investment.

Against this background, the *Report* serves as a critical reminder of the role competitiveness is called to play in both solving the world's international macroeconomic challenges and laying the ground for future prosperity.

Produced in collaboration with leading academics and a global network of Partner Institutes, *The Global Competitiveness Report 2016–2017* offers users a unique dataset of a broad array of competitiveness indicators for 138 economies. The data used in the *Report* are obtained from leading international sources as well as from the World Economic Forum's annual Executive Opinion Survey, a distinctive source that captures the perspectives of more than 14,000 business leaders on topics related to national competitiveness.

The Report presents the rankings of the Global Competitiveness Index (GCI). The GCI is based on 12 pillars that provide a comprehensive picture of the competitiveness landscape—the set of institutions, policies, and factors that determine the level of productivity of an economy—in countries around the world at different stages of economic development.

Detailed profiles highlighting competitive strengths and weaknesses for each of the 138 economies included in the Index as well as the interactive data platform are available at www.weforum.org/gcr.
